The kvsetkeys package

Heiko Oberdiek*
<heiko.oberdiek at googlemail.com>

2016/05/16 v1.17

Abstract

Package kvsetkeys provides \kvsetkeys, a variant of package keyval's \setkeys. It allows to specify a handler that deals with unknown options. Active commas and equal signs may be used (e.g. see babel's shorthands) and only one level of curly braces is removed from the values.

1 Documentation

First I want to recommend the very good review article "A guide to key-value methods" by Joseph Wright [1]. It introduces the different key-value packages and compares them.

1.1 Motivation

`\kvsetkeys` serves as replacement for keyval's `\setkeys`. It basically uses the same syntax. But the implementation is more robust and predictable:

Active syntax characters: Comma ',' and the equals sign '=' are used inside key value lists as syntax characters. Package keyval uses the catcode of the characters that is active during package loading, usually this is catcode 12 (other). But it can happen that the catcode setting of the syntax characters changes. Especially active characters are of interest, because some language adaptations uses them. For example, option turkish of package babel uses the equals sign as active shorthand character. Therefore package kvsetkeys deals with both catcode settings 12 (other) and 13 (active).

Brace removal: Package keyval's `\setkeys` removes up to two levels of curly braces around the value in some unpredictable way:

```
\setkeys{fam}{key={{value}}}    → value
\setkeys{fam}{key={{{value}}}}  → {value}
\setkeys{fam}{key= {{{value}}}} → {{value}}
```

This package kvsetkeys follows a much stronger rule: Exactly one level of braces are removed from an item, if the item is surrounded by curly braces. An item can be a the key value pair, the key or the value.

```
\kvsetkeys{fam}{key={value}}   → value
\kvsetkeys{fam}{key={{value}}  → {value}
\kvsetkeys{fam}{key= {{value}} → {value}
```

Arbitrary values: Unmatched conditionals are supported.

Before I describe \kvsetkeys in more detail, first I want to explain, how this package deals with key value lists. For the package also provides low level interfaces that can be used by package authors.

1.2 Normalizing key value lists

\kv@normalize{⟨*key value list*⟩}

If the user specifies key value lists, he usually prefers nice formatted source code, e.g.:

```
\hypersetup{
  pdftitle    = {...},
  pdfsubject  = {...},
  pdfauthor   = {...},
  pdfkeywords = {...},
  ...
}
```

Thus there can be spaces around keys, around = or around the value. Also empty entries are possible by too many commas. Therefore these spaces and empty entries are silently removed by package keyval and this package. Whereas the contents of the value can be protected by curly braces, especially if spaces or commas are used inside, a key name must not use spaces or other syntax characters.

\kv@normalize takes a key value list and performs the cleanup:

- Spaces are removed.
- Syntax characters (comma and equal sign) that are active are replaced by the same characters with standard catcode. (Example: babel's language option turkish uses the equal sign as active shorthand character.)

The result is stored in \kv@list, e.g.:

\kv@list → ,pdftitle={...},pdfsubject={...},...,

Curly braces around values (or keys) remain untouched.

v1.3+: One comma is added in front of the list and each pair ends with a comma. Thus an empty list consists of one comma, otherwise two commas encloses the list. Empty entries other than the first are removed.

v1.0 – v1.2: Empty entries are removed later. In fact it adds a comma at the begin and end to protect the last value and an easier implementation.

1.3 Parsing key value lists

\kv@parse{⟨*key value list*⟩}{⟨*processor*⟩}

It is easier to parse a normalized list, thus \kv@parse normalizes the list and calls \kv@parse@normalized.

`\kv@parse@normalized {⟨key value list⟩} {⟨processor⟩}`

Now the key value list is split into single key value pairs. For further processing the key and value are given as arguments for the ⟨*processor*⟩:

⟨*processor*⟩ {⟨*key*⟩} {⟨*value*⟩}

Also key and value are stored in macro names:

- `\kv@key` stores the key.
- `\kv@value` stores the value or if the value was not specified it has the meaning `\relax`.

The behaviour in pseudo code:

foreach (⟨*key*⟩, ⟨*value*⟩) in (⟨*key value list*⟩)
    `\kv@key` := ⟨*key*⟩
    `\kv@value` := ⟨*value*⟩
    ⟨*processor*⟩ {⟨*key*⟩} {⟨*value*⟩}

`\kv@break`

Since version 2011/03/03 v1.11 `\kv@break` can be called inside the ⟨*processor*⟩ of `\kv@parse` or `\kv@parse@normalized`, then the processing is stopped and the following entries discarded.

1.4 Processing key value pairs

Key value pairs can be processed in many different ways. For example, the processor for `\kvsetkeys` works similar to `\setkeys` of package keyval. There unknown keys raise an error.

Package xkeyval also knows a star form of `\setkeys` that stores unknown keys in an internal macro for further processing with `\setrmkeys` and similar macros. This feature is covered by processor `\kv@processor@known`.

1.4.1 Processing similar to keyval

`\kv@processor@default {⟨family⟩} {⟨key⟩} {⟨value⟩}`

There are many possiblities to process key value pairs. `\kv@processor@default` is the processor used in `\kvsetkeys`. It reimplements and extends the behaviour of keyval's `\setkeys`. In case of unknown keys `\setkeys` raise an error. This processer, however, calls a handler instead, if it is provided by the family. Both ⟨*family*⟩ and ⟨*key*⟩ may contain package babel's shorthands (since 2011/04/07 v1.13).

Since 2011/10/18 v1.15 the family handler can reject the successful handling of a key by calling `\kv@handled@false`.

Since 2016/05/16 v1.17 `\kv@processor@default` also defines macro `\kv@fam` with meaning ⟨*family*⟩ for convenience.

1.4.2 Processing similar to `\setkeys*` of package xkeyval

`\kv@processor@known {⟨family⟩} {⟨cmd⟩} {⟨key⟩} {⟨value⟩}`

The key value processor `\kv@processor@known` behaves similar to `\kv@processor@default`. If the ⟨*key*⟩ exists in the ⟨*family*⟩ its code is called, otherwise the family handler is tried. If the family handler is not set or cannot handle the key, the unknown key value pair is added to the macro ⟨*cmd*⟩. Since 2011/10/18 v1.15.

The behaviour in pseudo code:

if ⟨*key*⟩ exists
    call the keyval code of ⟨*key*⟩
else
    if ⟨*handler*⟩ for ⟨*family*⟩ exists
        handled = true
        ⟨*handler*⟩ {⟨*key*⟩} {⟨*value*⟩}
        if handled
        else
            add "{⟨*key*⟩}={⟨*value*⟩}" to {⟨*cmd*⟩}
        fi
    else
        add "{⟨*key*⟩}={⟨*value*⟩}" to {⟨*cmd*⟩}
        raise unknown key error
    fi
fi

Since 2016/05/16 v1.17 `\kv@processor@known` also defines macro `\kv@fam` with meaning ⟨*family*⟩ for convenience.

1.5 Default family handler

`\kv@processor@default` calls ⟨*handler*⟩, the default handler for the family, if the key does not exist in the family. The handler is called with two arguments, the key and the value. It can be defined with `\kv@set@family@hander`:

`\kv@set@family@handler {`⟨*family*⟩`} {`⟨*handler definition*⟩`}`

This sets the default family handler for the keyval family ⟨*family*⟩. Inside ⟨*handler definition*⟩ `#1` stands for the key and `#2` is the value. Also `\kv@key` and `\kv@value` can be used for the key and the value. If the value is not given, `\kv@value` has the meaning `\relax`.

`\kv@unset@family@handler {`⟨*family*⟩`}`

It removes the family handler for ⟨*family*⟩. Since 2011/10/18 v1.15.

1.6 Put it all together

`\kvsetkeys {`⟨*family*⟩`} {`⟨*key value list*⟩`}`

Macro `\kvsetkeys` processes the ⟨*key value list*⟩ with the standard processor `\kv@processor@default`:

`\kv@parse {`⟨*key value list*⟩`}{\kv@processor@default {`⟨*family*⟩`}}`

`\kvsetknownkeys {`⟨*family*⟩`} {`⟨*cmd*⟩`} {`⟨*key value list*⟩`}`

Macro `\kvsetknownkeys` processes the ⟨*key value list*⟩ with processor `\kv@processor@known`. All key value pairs with keys that are not known in ⟨*family*⟩ are stored in macro ⟨*cmd*⟩. A previous contents of macro ⟨*cmd*⟩ will be overwritten. If all keys can be handled, ⟨*cmd*⟩ will be empty, otherwise it contains a key value list of unhandled key value pairs. Since 2011/10/18 v1.15.

Pseudo code:

create macro ⟨*cmdaux*⟩ with unique name (inside the current group)
`\def`⟨*cmdaux*⟩{}

\kv@parse {⟨*key value list*⟩}{\kv@processor@known {⟨*family*⟩} {⟨*cmdaux*⟩}}
\let⟨*cmd*⟩=⟨*cmdaux*⟩

\kvsetkeys@expandafter {⟨*family*⟩} {⟨*list cmd*⟩}
\kvsetknownkeys@expandafter {⟨*family*⟩} {⟨*cmd*⟩} {⟨*list cmd*⟩}

Both macros behave like the counterparts without suffix `@expandafter`. The difference is that the key value list is given as macro that is expanded once. Since 2011/10/18 v1.15.

Thus you can replace `\setkeys` of package keyval by the key value parser of this package:

```
\renewcommand*{\setkeys}{\kvsetkeys}
or
\let\setkeys\kvsetkeys
```

1.7 Comma separated lists

Since version 2007/09/29 v1.3 this package also supports the normalizing and parsing of general comma separated lists.

\comma@normalize {⟨*comma list*⟩}

Macro `\comma@normalize` normalizes the comma separated list, removes spaces around commas. The result is put in macro `\comma@list`.

\comma@parse {⟨*comma list*⟩} {⟨*processor*⟩}

Macro `\comma@parse` first normalizes the comma separated list and then parses the list by calling `\comma@parse@normalized`.

\comma@parse@normalized {⟨*normalized comma list*⟩} {⟨*processor*⟩}

The list is parsed. Empty entries are ignored. ⟨*processor*⟩ is called for each non-empty entry with the entry as argument:

⟨*processor*⟩{⟨*entry*⟩}

Also the entry is stored in the macro `\comma@entry`.

\comma@break

Since version 2011/03/03 v1.11 `\comma@break` can be called inside the ⟨*processor*⟩ of `\comma@parse` or `\comma@parse@normalized`, then the processing is stopped and the following entries discarded.

2 Example

The following example prints a short piece of HTML code using the tabbing environment for indenting purpose and a key value syntax for specifying the attributes of an HTML tag. The example illustrates the use of a default family handler.

```
⟨*example⟩
\documentclass{article}
\usepackage[T1]{fontenc}
\usepackage{kvsetkeys}
\usepackage{keyval}
```

```
\makeatletter
\newcommand*{\tag}[2][]{%
  % #1: attributes
  % #2: tag name
  \begingroup
    \toks@={}%
    \let\@endslash\@empty
    \kvsetkeys{tag}{#1}%
    \texttt{%
      \textless #2\the\toks@\@endslash\textgreater
    }%
  \endgroup
}
\kv@set@family@handler{tag}{%
  % #1: key
  % #2: value
  \toks@\expandafter{%
    \the\toks@
    \space
    #1=\string"#2\string"%
  }%
}
\define@key{tag}{/}[]{%
  \def\@endslash{/}%
}
\makeatother

\begin{document}
\begin{tabbing}
  \mbox{}\qquad\=\qquad\=\kill
  \tag{html}\\
  \>\dots\\
  \>\tag[border=1]{table}\\
  \>\>\tag[width=200, span=3, /]{colgroup}\\
  \>\>\dots\\
  \>\tag{/table}\\
  \>\dots\\
  \tag{/html}\\
\end{tabbing}
\end{document}
⟨/example⟩
```

3 Implementation

3.1 Identification

```
⟨*package⟩
```

Reload check, especially if the package is not used with LaTeX.

```
\begingroup\catcode61\catcode48\catcode32=10\relax%

\fi
```

3.3 Check for ε-TEX

\unexpanded, \ifcsname, and \unless are used if found.

```
\begingroup\expandafter\endgroup
\ifcase0\ifetex@unexpanded
        \expandafter\ifx\csname ifcsname\endcsname\relax
        \else
          \expandafter\ifx\csname unless\endcsname\relax
          \else
            1%
          \fi
        \fi
      \fi
  \catcode`\$=9 % ignore
  \catcode`\&=14 % comment
\else % e-TeX
  \catcode`\$=14 % comment
  \catcode`\&=9  % ignore
\fi
```

3.4 Generic help macros

\KVS@Empty

```
\def\KVS@Empty{}
```

\KVS@FirstOfTwo

```
\long\def\KVS@FirstOfTwo#1#2{#1}
```

\KVS@SecondOfTwo

```
\long\def\KVS@SecondOfTwo#1#2{#2}
```

\KVS@IfEmpty

```
\long\def\KVS@IfEmpty#1{%
& \edef\KVS@Temp{\etex@unexpanded{#1}}%
$ \begingroup
$   \toks@{#1}%
$   \edef\KVS@Temp{\the\toks@}%
$ \expandafter\endgroup
  \ifx\KVS@Temp\KVS@Empty
    \expandafter\KVS@FirstOfTwo
  \else
    \expandafter\KVS@SecondOfTwo
  \fi
}
```

3.5 Normalizing

\kv@normalize

```
\long\def\kv@normalize#1{%
  \begingroup
    \toks@{,#1,}%
    \KVS@Comma
    \KVS@SpaceComma
    \KVS@CommaSpace
    \KVS@CommaComma
    \KVS@Equals
    \KVS@SpaceEquals
    \KVS@EqualsSpace
    \xdef\KVS@Global{\the\toks@}%
  \endgroup
  \let\kv@list\KVS@Global
}
```

\comma@normalize

```
\def\comma@normalize#1{%
  \begingroup
    \toks@{,#1,}%
    \KVS@Comma
    \KVS@SpaceComma
    \KVS@CommaSpace
    \KVS@CommaComma
    \xdef\KVS@Global{\the\toks@}%
  \endgroup
  \let\comma@list\KVS@Global
}
```

\KVS@Comma Converts active commas into comma with catcode other. Also adds a comma at the end to protect the last value for next cleanup steps.

```
\begingroup
  \lccode`\,=`\,%
  \lccode`\~=`\,%
\lowercase{\endgroup
  \def\KVS@Comma{%
    \toks@\expandafter{\expandafter}\expandafter
    \KVS@@Comma\the\toks@~\KVS@Nil
  }%
  \long\def\KVS@@Comma#1~#2\KVS@Nil{%
    \toks@\expandafter{\the\toks@#1}%
    \KVS@IfEmpty{#2}{%
    }{%
      \KVS@@Comma,#2\KVS@Nil
    }%
  }%
}
```

\KVS@SpaceComma Removes spaces before the comma, may add commas at the end.

```
\def\KVS@SpaceComma#1{%
  \def\KVS@SpaceComma{%
    \expandafter\KVS@@SpaceComma\the\toks@#1,\KVS@Nil

5 Installation

5.1 Download

Package. This package is available on CTAN[1]:

CTAN:macros/latex/contrib/oberdiek/kvsetkeys.dtx The source file.

CTAN:macros/latex/contrib/oberdiek/kvsetkeys.pdf Documentation.

Bundle. All the packages of the bundle 'oberdiek' are also available in a TDS compliant ZIP archive. There the packages are already unpacked and the documentation files are generated. The files and directories obey the TDS standard.

CTAN:install/macros/latex/contrib/oberdiek.tds.zip

TDS refers to the standard "A Directory Structure for TEX Files" (CTAN:tds/tds.pdf). Directories with texmf in their name are usually organized this way.

5.2 Bundle installation

Unpacking. Unpack the oberdiek.tds.zip in the TDS tree (also known as texmf tree) of your choice. Example (linux):

```
unzip oberdiek.tds.zip -d ~/texmf
```

Script installation. Check the directory TDS:scripts/oberdiek/ for scripts that need further installation steps. Package attachfile2 comes with the Perl script pdfatfi.pl that should be installed in such a way that it can be called as pdfatfi. Example (linux):

```
chmod +x scripts/oberdiek/pdfatfi.pl
cp scripts/oberdiek/pdfatfi.pl /usr/local/bin/
```

5.3 Package installation

Unpacking. The .dtx file is a self-extracting docstrip archive. The files are extracted by running the .dtx through plain TEX:

```
tex kvsetkeys.dtx
```

[1] http://ctan.org/pkg/kvsetkeys

TDS. Now the different files must be moved into the different directories in your installation TDS tree (also known as texmf tree):

```
kvsetkeys.sty            → tex/generic/oberdiek/kvsetkeys.sty
kvsetkeys.pdf            → doc/latex/oberdiek/kvsetkeys.pdf
kvsetkeys-example.tex    → doc/latex/oberdiek/kvsetkeys-example.tex
test/kvsetkeys-test1.tex → doc/latex/oberdiek/test/kvsetkeys-test1.tex
test/kvsetkeys-test2.tex → doc/latex/oberdiek/test/kvsetkeys-test2.tex
test/kvsetkeys-test3.tex → doc/latex/oberdiek/test/kvsetkeys-test3.tex
test/kvsetkeys-test4.tex → doc/latex/oberdiek/test/kvsetkeys-test4.tex
kvsetkeys.dtx            → source/latex/oberdiek/kvsetkeys.dtx
```

If you have a docstrip.cfg that configures and enables docstrip's TDS installing feature, then some files can already be in the right place, see the documentation of docstrip.

5.4 Refresh file name databases

If your TEX distribution (teTEX, mikTEX, ...) relies on file name databases, you must refresh these. For example, teTEX users run texhash or mktexlsr.

5.5 Some details for the interested

Unpacking with LATEX. The .dtx chooses its action depending on the format:

plain TEX: Run docstrip and extract the files.

LATEX: Generate the documentation.

If you insist on using LATEX for docstrip (really, docstrip does not need LATEX), then inform the autodetect routine about your intention:

```
latex \let\install=y\input{kvsetkeys.dtx}
```

Do not forget to quote the argument according to the demands of your shell.

Generating the documentation. You can use both the .dtx or the .drv to generate the documentation. The process can be configured by the configuration file ltxdoc.cfg. For instance, put this line into this file, if you want to have A4 as paper format:

```
\PassOptionsToClass{a4paper}{article}
```

An example follows how to generate the documentation with pdfLATEX:

```
pdflatex kvsetkeys.dtx
makeindex -s gind.ist kvsetkeys.idx
pdflatex kvsetkeys.dtx
makeindex -s gind.ist kvsetkeys.idx
pdflatex kvsetkeys.dtx
```

6 Catalogue

The following XML file can be used as source for the TEX Catalogue. The elements caption and description are imported from the original XML file from the Catalogue. The name of the XML file in the Catalogue is kvsetkeys.xml.

```
979 ⟨*catalogue⟩
980 <?xml version='1.0' encoding='us-ascii'?>
981 <!DOCTYPE entry SYSTEM 'catalogue.dtd'>
982 <entry datestamp='$Date$' modifier='$Author$' id='kvsetkeys'>
983   <name>kvsetkeys</name>
```

```
  <caption>Key value parser with default handler support.</caption>
  <authorref id='auth:oberdiek'/>
  <copyright owner='Heiko Oberdiek' year='2006,2007,2009-2012'/>
  <license type='lppl1.3'/>
  <version number='1.17'/>
  <description>
    This package provides \kvsetkeys, a variant of package
    <xref refid='keyval'>keyval</xref>'s <tt>\setkeys</tt>.  It allows
    the user to specify a handler that deals with unknown options.
    Active commas and equal signs may be used (e.g. see
    <xref refid='babel'>babel</xref>'s shorthands) and only one level
    of curly braces are removed from the values.
    <p/>
    The package is part of the <xref refid='oberdiek'>oberdiek</xref> bundle.
  </description>
  <documentation details='Package documentation'
      href='ctan:/macros/latex/contrib/oberdiek/kvsetkeys.pdf'/>
  <ctan file='true' path='/macros/latex/contrib/oberdiek/kvsetkeys.dtx'/>
  <miktex location='oberdiek'/>
  <texlive location='oberdiek'/>
  <install path='/macros/latex/contrib/oberdiek/oberdiek.tds.zip'/>
</entry>
⟨/catalogue⟩
```

7 References

[1] A guide to key-value methods, Joseph Wright, second draft for TUGBoat, 2009-03-17. http://www.texdev.net/wp-content/uploads/2009/03/keyval.pdf

[2] David Carlisle: *The keyval package*; 1999/03/16 v1.13; CTAN:macros/latex/required/graphics/keyval.dtx.

8 History

[2006/03/06 v1.0]

- First version.

[2006/10/19 v1.1]

- Fix of `\kv@set@family@handler`.
- Example added.

[2007/09/09 v1.2]

- Using package infwarerr for error messages.
- Catcode section rewritten.

[2007/09/29 v1.3]

- Normalizing and parsing of comma separated lists added.
- `\kv@normalize` rewritten.
- Robustness increased for normalizing and parsing, e.g. for values with unmatched conditionals.
- ε-TEX is used if available.
- Tests added for normalizing and parsing.

[2009/07/19 v1.4]

- Bug fix for `\kv@normalize`: unwanted space removed (Florent Chervet).

[2009/07/30 v1.5]

- Documentation addition: recommendation for Joseph Wright's review article.

[2009/12/12 v1.6]

- Short info shortened.

[2009/12/22 v1.7]

- Internal optimization (`\KVS@CommaSpace`, ..., `\KVS@EqualsSpace`).

[2010/01/28 v1.8]

- Compatibility to iniTEX added.

[2010/03/01 v1.9]

- Support of `\par` inside values.

[2011/01/30 v1.10]

- Already loaded package files are not input in plain TEX.

[2011/03/03 v1.11]

- `\kv@break` and `\comma@break` added.

[2011/04/05 v1.12]

- Error message with recovery action in help message (request by GL).

[2011/04/07 v1.13]

- `\kv@processor@default` supports package babel's shorthands.
- `\kv@set@family@handler` with shorthand support.

[2011/06/15 v1.14]

- Some optimizations in token register uses (GL, HO).

[2011/10/18 v1.15]

- `\kv@processor@known` and `\kvsetknownkeys` added.
- `\kvsetkeys@expandafter` and `\kvsetknownkeys@expandafter` added.
- Family handler can report success or failure by `\kv@handled@true` or `\kv@handled@false`.
- `\kv@unset@family@handler` added.

[2012/04/25 v1.16]

- `\kv@processor@default` and `\kv@processor@known` define macro `\kv@fam` for convenience.
- Catcode section: Catcode setting for + added for ε-TEX.

[2016/05/16 v1.17]

- Documentation updates.
