#### 1 Later Tex System Dependent Initialisations

This file implements the semi-automatic determination of various system dependent parts of the initialisation. The actual definitions may be placed in a file texsys.cfg. Thus for operating systems for which the tests here do not result in acceptable settings, a 'hand written' texsys.cfg may be produced.

The macros that must be defined are:

\@currdir

 $\cline{Courredir}\langle filename \rangle \langle space \rangle$  should expand to a form of the filename that uniquely refers to the 'current directory' if this is possible. (The expansion should also end with a space.) on UNIX, this is \def\@currdir{./}. For more exotic operating systems you may want to make \@currdir a macro with arguments delimited by . and/or  $\langle space \rangle$ . If the operating system has no concept of directory structure, this macro should be defined to be empty.

\input@path

If the primitive \openin searches the same directories as the primitive \input, then it is possible to tell (using \ifeof) whether a file exists before trying to input it. For systems like this, \input@path should be left undefined.

If \openin does not 'follow' \input then \input@path must be defined to be a list of directories to search for input files. The format for each directory is as for \@currdir, normally just a prefix is required, but it may be a macro with space-delimited argument. That is, if  $\langle dir \rangle$  is an entry in the input path, T<sub>F</sub>X will try to load the expansion of  $\langle dir \rangle \langle filename \rangle \langle space \rangle$ 

So either  $\langle dir \rangle$  should be defined as a macro with argument delimited by space, or it should just expand to a directory name, including the final directory separator, so that it may be concatenated with the  $\langle filename \rangle$ . This means that for UNIX-like syntax, each  $\langle dir \rangle$  should end with a slash, /.

\input@path should expand to a list of such directories, each in a {} group.

After a call of the form:  $filename@parse{\langle filename \rangle}$ , the three macros

\filename@area,\filename@base,\filename@ext should be defined to be the 'area' (or directory), basename and extension respectively. If there was no extension specified in  $\langle filename \rangle$ ,  $\filename@ext should be <math>\ensuremath{\mbox{let}}$  to  $\ensuremath{\mbox{relax}}$  (so this case may be tested with \@ifundefined{filename@ext} and, perhaps a default extension substituted).

Normally one would not need to define this macro in texsys.cfg as the automatic tests can supply parsers that work with UNIX and VMS and Macintosh syntax, as well as a basic parser that will cover many other cases. However some operating systems may need a 'hand produced' parser in which case it should be defined in this file.

The UNIX parser also works for most MSDOS TEX versions. Currently if the UNIX, VMS or Macintosh parser is not used, \filename@parse is defined to always return an empty area, and to split the argument into basename and extension at the first '.' that occurs in the name. Parsers for other formats may be defined in texsys.cfg, in which case they will be used in preference to the default definitions.

\@TeXversion

\@TeXversion is now set automatically by the initialisation tests in this file. You should not need to set it in texsys.cfg, however the following documentation

\filename@parse

is left for information. LATEX does not set this variable exactly, the automatic tests set it to:

```
2 for any version, v, v < 3.0
```

3 for any version, v,  $3.0 \le v \le 3.14$ 

 $\langle undefined \rangle$  otherwise.

However these values are accurate enough for LATEX to take appropriate action for these old TEXs.

If your T<sub>E</sub>X is older than version 3.141, then you should define \@TeXversion (using \def) to be the version number. If you do not do this , L<sup>A</sup>T<sub>E</sub>X will not work around a bug in old T<sub>E</sub>X versions, and so error messages will appear in a very strange format, with ^J appearing instead of line breaks:

```
! LaTeX Error: \rubbish undefined.^^J^^JSee the LaTeX manual or LaTeX Companion for explanation.^^JType H <return> for immediate help.
...

1.3 \renewcommand{\rubbish}
```

However if you put \def\@TeXversion{3.14} in texsys.cfg the following format will be used:

```
! LaTeX Error: \rubbish undefined.
```

```
See the LaTeX manual or LaTeX Companion for explanation.

Type H <return> for immediate help.
! .
...

1.3 \renewcommand{\rubbish}
```

Note that this has an extra line ! . which does not appear in error messages that use the default settings with a current version of  $T_EX$ , but this should not cause any confusion we hope.

#### 2 Initialisation

As this file is read at a very early stage, some definitions that are normally considered to be part of the format must be made here.

#### 2.1 INITEX

```
1 \langle *dircheck \rangle

2 \langle *initex \rangle

3 \langle initex \rangle \setminus ifnum \setminus catcode' \setminus \{=1

4 \langle initex \rangle \setminus \{LaTeX \ must \ be \ made \ using \ an \ initex \ with \ no \ format \ preloaded \}
```

<sup>&</sup>lt;sup>1</sup>Actually if your T<sub>E</sub>X is really old, version 2, LAT<sub>E</sub>X can detect this, and sets \@TeXversion to 2 if it is not set in the cfg file.

```
6 (initex)\fi
7 \catcode'\{=1
8 \catcode'\}=2
```

If LuaT<sub>E</sub>X is in use the extensions and other new primitives have to be activated: this is done as early as possible. Older versions of LuaT<sub>E</sub>X do not hide the primitives: a version check is not needed as the version itself will be missing in the case where action is needed!

```
9 \ifx\directlua\undefined
10 \else
11 \ifx\luatexversion\undefined
Enable e-TeX/pdfTeX/Umath primitives with their natural names
12 \directlua{tex.enableprimitives("",%
13 tex.extraprimitives('etex', 'pdftex', 'umath'))}
```

In current formats enable primitives with unprefixed names. the latexrelease guards allow the primitives to be defined with a \luatex prefix if older formats are specified.

```

## 3 texsys.cfg

As mentioned above, any site specific definitions required to describe the filename handling must be entered into a file texsys.cfg. If texsys.cfg can not be located by \openin, we write a default version out. The default version only contains comments, so we do not actually input the file in that case. The automatic tests later will, hopefully, correctly define the required macros.

The tricky code below checks to see if texsys.cfg exists. If it does not, all the text in this file between START and END is copied verbatim to a new file texsys.cfg. If texsys.cfg is found, then it is simply input. This is only done when this file is being used unstripped.

```

#### 3.1 texsys.cfg

This file contains the site specific definitions of the four macros \@currdir, \input@path, \filename@parse and \@TeXversion.

As distributed it only contains comments, however this 'empty' file will work on many systems because of the automatic tests built into ltdirchk.dtx. You are allowed to edit this file to add definitions of these macros appropriate to your system.

The macros that must be defined are:

\@currdir

 $\colongraphical content of the filename of the filename that uniquely refers to the 'current directory' if this is possible. (The expansion should also end with a space.) on UNIX, this is <math>\colongraphical content of the filename that uniquely refers to the 'current directory' if this is possible. (The expansion should also end with a space.) on UNIX, this is <math>\colongraphical content of the filename that uniquely refers to the 'current directory' if this is possible. (The expansion should also end with a space.) For more exotic operating systems you may want to make <math>\colongraphical content of the filename that uniquely refers to the 'current directory' if this is possible. (The expansion should also end with a space.) If the operating system has no concept of directory structure, this macro should be defined to be empty.$ 

\input@path

If the primitive \openin searches the same directories as the primitive \input, then it is possible to tell (using \ifeof) whether a file exists before trying to input it. For systems like this, \input@path should be left undefined.

If **\openin** does not 'follow' **\input** then **\input@path** must be defined to be a list of directories to search for input files. The format for each directory is as for **\@currdir**, normally just a prefix is required, but it may be a macro with space-delimited argument. That is, if  $\langle dir \rangle$  is an entry in the input path, TeXwill try to load the expansion of

 $\langle dir \rangle \langle filename \rangle \langle space \rangle$ 

So either  $\langle dir \rangle$  should be defined as a macro with argument delimited by space, or it should just expand to a directory name, including the final directory separator, so that it may be concatenated with the  $\langle filename \rangle$ . This means that for UNIX-like syntax, each  $\langle dir \rangle$  should end with a slash, /. One exception to this rule is that the input path should always contain the empty directory {} as this will allow 'full pathnames' to be used, and the 'current directory' to be searched.

\input@path should expand to a list of such directories, each in a {} group.

\filename@parse

After a call of the form:  $\filename@parse{\langle filename\rangle}$ , the three macros  $\filename@area,\filename@base,\filename@ext}$  should be defined to be the 'area' (or directory), basename and extension respectively. If there was no extension specified in  $\langle filename\rangle$ ,  $\filename@ext}$  should be  $\tilename$  (so this case may be tested with  $\tilename@filename@ext\}$  and, perhaps a default extension substituted).

Normally one would not need to define this macro in texsys.cfg as the automatic tests can supply parsers that work with UNIX and VMS syntax, as well as a basic parser that willcover many other cases. However some operating systems may need a 'hand produced' parser in which case it should be defined in this file.

The UNIX parser also works for most MSDOS TEX versions. Currently if the UNIX or VMS parser is not used, \filename@parse is defined to always return an empty area, and to split the argument into basename and extension at the first '.' that occurs in the name. Parsers for other formats may be defined in texsys.cfg, in which case they will be used in preference to the default definitions.

\@TeXversion

You should not need to set this macro in texsys.cfg. IATEX tests to set this automatically. See the comments in the opening section of ltdirchk.dtx.

The following sections give examples of definitions which might work on various systems. These are currently mainly untested as I only have access to a few systems, all of which do not need this file as the automatic tests work. All the code is commented out.

### 3.2 UNIX (web2c)

This implementation does make \openin and \input look in the same places. Acceptable settings are made by ltdirchk.dtx, and so this file may be empty. The definitions below are therefore just for information.

```
130 %\def\@currdir{./}
131 %\let\input@path\@undefined
```

### 3.3 UNIX (other)

Apparently some commercial UNIX implementations have different paths for \openin and \input. For these one could use definitions like the following (with whatever directories are used at your site): note that the directory names should end with /.

```
132 % \def\@currdir{./}
133 % \def\input@path{%
134 % {/usr/local/lib/tex/inputs/distrib/}%
135 % {/usr/local/lib/tex/inputs/contrib/}%
136 % {/usr/local/lib/tex/inputs/local/}%
137 % }
```

### 3.4 MSDOS (emtex)

This implementation does make \openin and \input look in the same places. Acceptable settings are made by ltdirchk.dtx, and so this file may be empty. The definitions below are therefore just for information.

```
138 % \def\@currdir{./}
139 % \let\input@path\@undefined
```

### 3.5 MSDOS (other)

Some PC implementations have different paths for **\openin** and **\input**. For these one could use definitions like the following (with whatever directories are used at your site): note that the directory names should end with /. This assumes the implementation uses UNIX style / as the directory separator.

```
140 % \def\@currdir{./}
141 % \def\input@path{%
142 % {c:/tex/inputs/distrib/}%
143 % {c:/tex/inputs/contrib/}%
144 % {c:/tex/inputs/local/}%
145 % }
```

### 3.6 VMS (DECUS TEX, PD VMS 3.6)

This implementation does make \openin and \input look in the same places. Acceptable settings are made by ltdirchk.dtx, and so this file may be empty. The definitions below are therefore just for information.

```
146 % \def\@currdir{[]}
147 % \let\input@path\@undefined
```

#### 3.7 VMS (???)

Some VMS implementations have different paths for **\openin** and **\input**. For these one could use definitions like the following:

```
148 % \def\@currdir{[]}
149 % \def\input@path{%
150 % {tex_inputs:}%
151 % {SOMEDISK: [SOME.TEX.DIRECTORY]}%
152 % }
```

### 3.8 MACINTOSH (OzTeX 1.6)

This implementation does make \openin and \input look in the same places. Acceptable settings are made by ltdirchk.dtx, and so this file may be empty. The definitions below are therefore just for information.

```
153 % \def\@currdir{:}
154 % \let\input@path\@undefined
```

### 3.9 MACINTOSH (other)

Some Macintosh implementations have different paths for **\openin** and **\input**. For these one could use definitions like the following (with whatever folders are used on your machine): note that the directory names should end with :, and they should contain *no* spaces.

```
155 % \def\@currdir{:}
156 % \def\input@path{%
157 % {Hard-Disk:Applications:TeX:TeX-inputs:}%
158 % {Hard-Disk:Applications:TeX:My-inputs:}%
159 % }
```

#### 3.10 FAKE EXAMPLE

This example is for an operating system that has filenames of the form <area>name For maximum compatibility with macro sets, you want name.ext to be mapped to <ext>name. and <area>name.ext to be mapped to <area.ext>name. \input does this mapping automatically, but \openin does not, and does not look in the same places as \input. <>name is the desired 'current directory' syntax.

the following code would possibly work:

```
160 % \def\@dir#1#2 {%
161 %
       \@d@r{#1}#2..\@ni1}
162 % \def\@d@r#1#2.#3.#4\@ni1{%
       < \\ ifx\\@dir\\else\\1\\ifx\\@dir\\else.\\fi\\fi\\#3>\#2\\ \}
163 %
164 %
165 % \def\@currdir{\@dir{}}
166 % \def\input@path{%
167 %
      {\@dir{area.one}}%
168 %
       {\@dir{area.two}}%
169 % }
END
170 \immediate\closeout15
```

If texsys.cfg did exist, then input it.

```
171 \else
172 \typeout{** Using the existing texsys.cfg}
173 \closein15
174 \input texsys.cfg
175 \fi
176 \/docstrip\
```

If the stripped version of this file is being used (in latex2e.ltx) then texsys.cfg should be there, so just input it.

```
177 (dircheck)\input texsys.cfg
```

## 4 Setting \@currdir

\@currdir \IfFileExists

\today

This is a local definition of \IffileExists. It tries to relocate texsxys.aux. If it succeeds, then the \@currdir syntax has been determined. If all the tests fail then \@currdir will be set to \@empty, and ltxcheck will warn of this when it checks the format.

```
178 \begingroup
179 \count@\time
180 \divide\count@ 60
181 \count2=-\count@
182 \multiply\count2 60
183 \advance\count2 \time

The current date and time stamp.

184 \edef\today{%
185 \the\year/\two@digits{\the\month}/\two@digits{\the\day}:%
```

\two@digits{\the\count@}:\two@digits{\the\count2}}

Create a file texsys.aux (hopefully in the current directory), then try to locate it again.

```
187 \immediate\openout15=texsys.aux
188 \immediate\write15{\today^^J}
189 \immediate\closeout15 %
   #1 is the file to try, #2 is what to do on success, #3 on failure.
190 \def\IfFileExists#1#2#3{%
191
     \openin\@inputcheck#1 %
192
     \ifeof\@inputcheck
193
        #3\relax
194
     \else
       \read\@inputcheck to \reserved@a
195
       \ifx\reserved@a\today
196
         \typeout{#1 found}#2\relax
197
198
          \typeout{BAD: old file \reserved@a (should be \today)}%
199
200
         #3\relax
201
       \fi
202
     \closein\@inputcheck}
203
```

File a: ltdirchk.dtx Date: 2015/10/02 Version v1.2a

204 \endlinechar=-1

If \@currdir has not been pre-defined in texsys.cfg then test for UNIX, VMS and Oz-T<sub>F</sub>X-Mac. syntax.

```
205 \ifx\@currdir\@undefined
206 \IfFileExists{./texsys.aux}{\gdef\@currdir{./}}%
207 {\IfFileExists{[]texsys.aux}{\gdef\@currdir{[]}}%
208 {\IfFileExists{:texsys.aux}{\gdef\@currdir{:}}}}}
```

If it is still undefined at this point, all the above tests failed. Earlier versions interactively prompted for a definition at this point, but it seems impossible to reliably obtain information from users at this point in the installation. This version of the file produces a format with no user-interaction. Later if the format is not suitable for the system, texsys.cfg may be edited and the format re-made.

```
209 \ifx\@currdir\@undefined
210 \global\let\@currdir\@empty
211 \typeout{^^J^^J%
212 !! No syntax for the current directory could be found^^J%
213 }%
214 \fi
```

Otherwise \@currdir was defined in texsys.cfg. In this case check that the syntax specified works on this system. (In case a complete LATEX system has been copied from one system to another.) If the test fails, give up. The installer should remove or correct the offending texsys.cfg and try again.

```
215 \else
216
     \IfFileExists{\@currdir texsys.aux}{}{%
217
       \edef\reserved@a{\errhelp{%
         texsys.cfg specifies the current directory syntax to be^^J\!\!\!\!/

229
   Stop here if the file is being used unstripped.
230 (*docstrip)
231 \relax\endinput
232 (/docstrip)
```

# 5 Setting \input@path

Earlier versions of this file attempted to automatically test whether \input@path was required, and interactively prompt for a path if necessary. This was not found to be very reliable The first-time installer of IATEX  $2_{\varepsilon}$  can not be expected to have enough information to supply the correct information to the prompts. Now

the interaction is omitted. After the format is made the installer can attempt to run the test document ltxcheck.tex through  $\LaTeX$  2 $\varepsilon$ . This will check, amongst other things, whether texsys.cfg will need to be edited and the format remade.

\input@path Now set up the \input@path.

\input@path should either be undefined, or a list of directories as described in the introduction.

```
\typeout{^^J%
233

# 7 TeX Versions

\@TeXversion

TEX versions older than than 3.141 require \@TeXversion to be set. This can be determined automatically due to a trick suggested by Bernd Raichle. (Actually this will not always get the correct version number, eg TEX3.14 would be detected as TEX3, but LATEX only needs to take account of TEX's older than 3, or between 3 and 3.14.

```

```

#### 8 ltxcheck.tex

After the format has been made, and article.cls moved with the other files to the 'standard input directory' as specified in install.txt, the format may be checked by running the file ltxcheck.tex.

#### File b

# ltplain.dtx

#### Plain T<sub>E</sub>X 9

LATEX includes almost all of the functionality of Knuth's original 'Basic Macros' That is, the plain T<sub>F</sub>X format described in Appendix B of the T<sub>F</sub>XBook. However, some of the user commands are not much use so, in order to save memory, we may remove them from the kernel into a package. Here is a list of the commands that may be removed (PROBABLY NOT COMPLETE).

```
\magstep
             \magstephalf
\mathhexbox
\vglue
            \vgl@
\hglue
            \hgl@
```

This file is by now very small as most of it has been moved to more appropriate kernel files: it may disappear completely one day.

E<sup>A</sup>T<sub>F</sub>X font definitions are done using NFSS2 so none of PLAIN's font definitions are in LATEX.

LATEX has its own tabbing environment, so PLAIN's is disabled.

LATEX uses its own output routine, so most of the plain one was removed.

```
1 (*2ekernel)
2 \catcode'\{=1 % left brace is begin-group character
3 \catcode'\}=2 % right brace is end-group character
4 \catcode'\$=3 % dollar sign is math shift
5 \cdot 6^{-4} \% ampersand is alignment tab
6 \catcode'\#=6 \% hash mark is macro parameter character
7 \catcode'\^=7 % circumflex and uparrow are for superscripts
8 \catcode'\_=8 % underline and downarrow are for subscripts
9 \catcode'\^^I=10 % ascii tab is a blank space
10 \chardef\active=13 \catcode'\~=\active % tilde is active
11 \catcode'\^^L=\active \def^^L{\par}% ascii form-feed is \par
12 \message{catcodes,}
```

We had to define the \catcodes right away, before the message line, since \message uses the { and } characters. When INITEX (the TeX initializer) starts up, it has defined the following \catcode values:

```
\catcode'\^^@=9 % ascii null is ignored
\catcode'\^^M=5 % ascii return is end-line
\catcode'\\=0 %
                     backslash is TeX escape character
\catcode'\%=14 %
                     percent sign is comment character
\catcode'\ =10 % ascii space is blank space
\catcode'\^^?=15 % ascii delete is invalid
\c \catcode '\A=11 ... \catcode '\Z=11 % uppercase letters
\catcode'\a=11 ... \catcode'\z=11 % lowercase letters
all others are type 12 (other)
   Here is a list of the characters that have been specially catcoded:
```

```
13 \def\dospecials{\do} \do\{\do}\do\%\do\%%
   \do\#\do\^\do\_\do\%\do\~}
```

(not counting ascii null, tab, linefeed, formfeed, return, delete) Each symbol in the list is preceded by , which can be defined if you want to do something to every item in the list.

We make @ signs act like letters, temporarily, to avoid conflict between user names and internal control sequences of plain format.

#### 15 \catcode'@=11

To make the plain macros more efficient in time and space, several constant values are declared here as control sequences. If they were changed, anything could happen; so they are private symbols.

```
\One Small constants are defined using \chardef.
```

```
\tw0 _{16} \chardef\chardef
```

 $\t 17 \chardef\t 0=2$ 

\sixt@@n 18 \chardef\thr@@=3

\@MM 23 \mathchardef\@M=10000

24 \mathchardef\@MM=20000

#### Allocation of registers

Here are macros for the automatic allocation of \count, \box, \dimen, \skip, \muskip, and \toks registers, as well as \read and \write stream numbers, \fam codes, \language codes, and \insert numbers.

#### 25 \message{registers,}

When a register is used only temporarily, it need not be allocated; grouping can be used, making the value previously in the register return after the close of the group. The main use of these macros is for registers that are defined by one macro and used by others, possibly at different nesting levels. All such registers should be defined through these macros; otherwise conflicts may occur, especially when two or more macro packages are being used at the same time.

The following counters are reserved:

- 0 to 9 page numbering
  - 10 count allocation
  - 11 dimen allocation
  - 12 skip allocation
  - 13 muskip allocation
  - 14 box allocation
  - 15 toks allocation
  - 16 read file allocation
  - 17 write file allocation
  - 18 math family allocation
  - 19 language allocation
  - 20 insert allocation
  - 21 the most recently allocated number
  - 22 constant -1

New counters are allocated starting with 23, 24, etc. Other registers are allocated starting with 10. This leaves 0 through 9 for the user to play with safely, except that counts 0 to 9 are considered to be the page and subpage numbers (since they are displayed during output). In this scheme, \count 10 always contains the number of the highest-numbered counter that has been allocated, \count 14 the highest-numbered box, etc. Inserts are given numbers 254, 253, etc., since they require a \count, \dimen, \skip, and \box all with the same number; \count 20 contains the lowest-numbered insert that has been allocated. Of course, \box255 is reserved for \output; \count255, \dimen255, and \skip255 can be used freely.

It is recommended that macro designers always use \global assignments with

```
respect to registers numbered
           1, 3, 5, 7, 9,
           and always non-\global assignments with respect to registers
           0, 2, 4, 6, 8, 255.
           This will prevent "save stack buildup" that might otherwise occur.
            26 \count10=22 % allocates \count registers 23, 24, ...

           42 \dimendef\dimen@=0
  \skip@
           43 \dimendef\dimen@i=1 % global only
           44 \dimendef\dimen@ii=2
            45 \skipdef\skip@=0
           46 \toksdef\toks@=0
           Now, we define \newcount, \newbox, etc. so that you can say \newcount\foo and
           \foo will be defined (with \countdef) to be the next counter.
              To find out which counter \foo is, you can look at \allocationnumber.
              Since there's no \boxdef command, \chardef is used to define a \newbox,
           \newinsert, \newfam, and so on.
```

\insc@unt

\m@ne

\dimen@i

\toks@

\newcount \newdimen

\newskip

\newread \newwrite

\newlanguage

\newmuskip \newbox

\allocationnumber

LATEX change: remove \outer from \newcount and \newdimen (FMi) This is necessary to use \newcount inside \if... later on. Also remove from \newskip, \newbox \newwrite and \newfam (DPC) to save later redefinition.

47 (/2ekernel)

```

LATEX defines ~ in ltdefns.dtx.

Most text commands are actually encoding specific and therefore defined later, so commented out or removed from this file.

begins a paragraph, if necessary \leavevmode

 $421 \def\leavevmode{\unhbox\voidb@x}$ 

\mathhexbox

422 \def\mathhexbox#1#2#3{\mbox{\$\m@th \mathchar"#1#2#3\$}}

\ialign

423 \def\ialign{\everycr{}\tabskip\z@skip\halign} % initialized \halign

\oalign

\o@lign 424 \def\oalign#1{\leavevmode\vtop{\baselineskip\z@skip \lineskip.25ex%

\ooalign 425 \ialign{##\crcr#1\crcr}}}

426 \def\o@lign{\lineskiplimit\z@ \oalign}

427 \def\ooalign{\lineskiplimit-\maxdimen \oalign}

The definition of this macro in plain.tex was improved in about 1997; but as a \sh@ft result its usage was changed and its new definition is not appropriate for LATEX.

Since the version given here has been in use by LATEX for many years it does not seem prudent to remove it now. As far as we can tell it has only been used to define \b and \d but this cannot be certain.

 $428 \def\sh@ft#1{\dimen@.00#1ex\multiply\dimen@\fontdimen1\font}$ 

\kern-.0156\dimen@} % compensate for slant in lowered accents

\ltx@sh@ft

This is the LATEX version of the second incarnation of the plain macro \shCft, which takes a dimension as its argument. It shifts a pseudo-accent horizontally by an amount proportional to the product of its argument and the slant-per-point (fontdimen 1).

 $430 \left( +11\% \right)$ 

\dimen@ #1% 431

\kern \strip@pt 432

\fontdimen1\font \dimen0 433

} % kern by #1 times the current slant

LATEX change: the text commands such as \d, \b, \c, \copyright, \TeX are now defined elsewhere.

LATEX change: Make \t work in a moving argument. Now defined elsewhere.

\dotfill

\hrulefill LaTeX change: \kern\z@ added to end of \hrulefill and \dotfill to make them work in 'tabular' and 'array' environments. (Change made 24 July 1987). LATEX change: \leavevmode added at beginning of \dotfill and \hrulefill so that they work as expected in vertical mode.

 $435 \def\hrulefill{\leavevmode\leaders\hrule\hfill\kern\z@}$ 

The box in \dotfill originally contained (in plain.tex):

\mkern 1.5mu .\mkern 1.5mu;

the width of .44em differs from this by .04pt which is probably an acceptable difference within leaders.

436 \def\dotfill{%

# ltvers.dtx

## 10 Version Identification

First we identify the date and version number of this release of LATEX, and set \everyjob so that it is printed at the start of every LATEX run.

Check that the format being made is not too old. The error message complains about 'more than 5 years' but in fact the error is not triggered until 65 months.

This code is currently not activated as we don't know if we already got to the last official 2e version (due to staff shortage or due to a successor (think positive:-)).

```
11 \iffalse
12 \def\reserved@a#1/#2/#3\@nil{%
13 \count@\year
14 \advance\count@-#1\relax
15 \multiply\count@ by 12\relax
16 \advance\count@\month
17 \advance\count@-#2\relax}
18 \expandafter\reserved@a\fmtversion\@nil
```

\count@ is now the age of this file in months. Take a generous definition of 'year' so this message is not generated too often.

```
19 \ifnum\count@>65

# ltdefns.dtx

#### 11 **Definitions**

This section contains commands used in defining other macros.

 $_1$   $\langle *2ekernel \rangle$ 

#### 11.1 Initex initialisations

\two@digits Prefix a number less than 10 with '0'.

2 \def\two@digits#1{\ifnum#1<10 0\fi\number#1}</pre>

\typeout Display something on the terminal.

3 \def\typeout#1{\begingroup\set@display@protect

\immediate\write\@unused{#1}\endgroup}

\newlinechar A char to be used as new-line in output to files.

5 \newlinechar'\^^J

## Saved versions of T<sub>E</sub>X primitives

The TeX primitive \foo is saved as \@@foo. The following primitives are handled in this way:

\@@par

6 \let\@@par=\par

7 %\let\@@input=\input %%% moved earlier

 $8 \% \text{let}@end=\end$ %%%

**\@@hyph** Save original primitive definition.

9 \let\@@hyph=\-

\@@italiccorr Save the original italic correction.

10 \let\@@italiccorr=\/

The following definitions save token space. E.g., using \@height instead of height \@height

saves 5 tokens at the cost in time of one macro expansion. \@depth

\@width 11 \def\@height{height} \def\@depth{depth} \def\@width{width}

\@minus 12 \def\@minus{minus} 13 \def\@plus{plus} \@plus

\hb@xt@ The next one is another 100 tokens worth.

14 \def\hb@xt@{\hbox to}

15 \message{hacks,}

#### 11.3 Command definitions

This section defines the following commands:

\@namedef

 $\{\langle NAME \rangle\}$ 

Expands to  $\langle NAME \rangle$ , except name can contain any characters.

 $\{\langle NAME \rangle\}$ \@nameuse

Expands to  $\{\langle NAME \rangle\}$ .

 $X\{\langle YES \rangle\}\{\langle NO \rangle\}$ \@ifnextchar

Expands to  $\langle YES \rangle$  if next character is an 'X', and to  $\langle NO \rangle$  otherwise. (Uses \reserved@a-\reserved@c.) NOTE: GOBBLES ANY SPACE FOLLOWING

\@ifstar

 $\{\langle YES \rangle\}\{\langle NO \rangle\}$ 

Gobbles following spaces and then tests if next the character is a '\*'. If it is, then it gobbles the '\*' and expands to  $\langle YES \rangle$ , otherwise it expands to  $\langle NO \rangle$ .

\@dblarg

 $\{\langle CMD \rangle\}\{\langle ARG \rangle\}$ 

Expands to  $\{(CMD)\}[(ARG)]\{(ARG)\}$ . Use **\@dblarg\CS** when **\CS** takes arguments [ARG1] {ARG2}, where default is ARG1 = ARG2.

\@ifundefined

 $\{\langle NAME \rangle\}\{\langle YES \rangle\}\{\langle NO \rangle\}$ 

: If \NAME is undefined then it executes  $\langle YES \rangle$ , otherwise it executes  $\langle NO \rangle$ . More precisely, true if  $\NAME$  either undefined or  $= \relax$ .

\@ifdefinable

 $\NAME\{\langle YES \rangle\}\$  Executes  $\langle YES \rangle$  if the user is allowed to define  $\NAME$ , otherwise it gives an error. The user can define \NAME if \Oifundefined{NAME} is true, 'NAME' ≠ 'relax' and the first three letters of 'NAME' are not 'end', and if \endNAME is not defined.

\newcommand

 $*\{\langle FOO \rangle\} [\langle i \rangle] \{\langle TEXT \rangle\}$ 

User command to define  $\F00$  to be a macro with i arguments (i = 0 if missing) having the definition  $\langle TEXT \rangle$ . Produces an error if \F00 already defined.

Normally the command is defined to be \long (ie it may take multiple paragraphs in its argument). In the star-form, the command is not defined as \long and a blank line in any argument to the command would generate an error.

\renewcommand

 $*\{\langle FOO \rangle\} [\langle i \rangle] \{\langle TEXT \rangle\}$ 

Same as \newcommand, except it checks if \FOO already defined.

\newenvironment

 $*{\langle FOO \rangle}[\langle i \rangle]{\langle DEF1 \rangle}{\langle DEF2 \rangle}$ 

equivalent to:

(or the appropriate star forms).

\renewenvironment

Obvious companion to \newenvironment.

\@cons : See description of **\output** routine.

 $\c T1 T2 \dots Tn\c = T1 (unexpanded)$ \@car

 $\cdot T1 T2 \ldots Tn\cdot == T2 \ldots Tn (unexpanded)$ \@cdr

\typeout  $\{\langle message \rangle\}$ 

Produces a warning message on the terminal.

\typein

 $\{\langle message \rangle\}$ 

Types message, asks the user to type in a command, then executes it

 $[\langle \backslash CS \rangle] \{\langle MSG \rangle\}$ \typein

Same as above, except defines \CS to be the input instead of executing it.

\typein

16 \def\typein{%

```
60 \long\def\@xargdef#1[#2][#3]#4{%
```

61 \@ifdefinable#1{%

Define the actual command to be:

```
\def\foo{\@protected@testopt\foo\\foo{default}}
```

where \foo is a csname generated from applying \csname and \string to \foo, ie the actual name contains a backslash and therefore can't clash easily with existing command names. "Default" is the contents of the second optional argument of (re)newcommand.

```
62 \expandafter\def\expandafter#1\expandafter{%
63 \expandafter
64 \@protected@testopt
65 \expandafter
66 #1%
67 \csname\string#1\endcsname
68 {#3}}
```

Now we define the internal macro ie **\\foo** which is supposed to pick up all arguments (optional and mandatory).

```
69 \expandafter\@yargdef
70 \csname\string#1\endcsname
71 \tw@
72 {#2}%
73 {#4}}}
```

\@testopt

This macro encapsulates the most common call to \@ifnextchar, saving several tokens each time it is used in the definition of a command with an optional argument. #1 The code to execute in the case that there is a [ need not be a single token but can be any sequence of commands that 'expects' to be followed by [.

If this command were only used in \newcommand definitions then #1 would be a single token and the braces could be omitted from {#1} in the definition below, saving a bit of memory.

```
74 \long\def\@testopt#1#2{%
75 \kernel@ifnextchar[{#1}{#1[{#2}]}}
```

\@protected@testopt

Robust version of \@testopt. The extra argument (#1) must be a single token. If protection is needed the call expands to \protect applied to this token, and the 2nd and 3rd arguments are discarded (by \@x@protect). Otherwise \@testopt is called on the 2nd and 3rd arguments.

This method of making commands robust avoids the need for using up two csnames per command, the price is the extra expansion time for the \ifx test.

```
76 \def\@protected@testopt#1{%%
77 \ifx\protect\@typeset@protect
78 \expandafter\@testopt
79 \else
80 \@x@protect#1%
81 \fi}
```

\@yargdef
\@yargd@f

These generate a primitive argument specification, from a LATEX [ $\langle digit \rangle$ ] form; in fact  $\langle digit \rangle$  can be anything such that  $\langle digit \rangle$  is single digit.

Reorganised slightly so that <text> works. I am not sure this is worth it, as a following <page-header> would over-write the definition of  $\$ 

Recall that LATEX2.09 goes into an infinite loop with \renewcommand[1]{\@tempa}{foo} (DPC 6 October 93).

Reorganised again (DPC 1999). Rather than make a loop to construct the argument spec by counting, just extract the required argument spec by using a delimited argument (delimited by the digit). This is faster and uses less tokens. The coding is slightly odd to preserve the old interface (using #2 = \two as the flag to surround the first argument with []. But the new method did not allow for the number of arguments #3 not being given as an explicit digit; hence (further expansion of this argument and use of) \number was added later in 1999.

It is not clear why these are still \long.

```
82 \long \def \@yargdef #1#2#3{%
83
    \ifx#2\tw@
      \def\reserved@b##11{[####1]}%
84

```

#### \renewcommand

Check the command name is already used. If not give an error message. Then temporarily disable  $\ensuremath{\mbox{\tt Cifdefinable}}$  then call  $\ensuremath{\mbox{\tt Newcommand}}$ . (Previous version  $\ensuremath{\mbox{\tt Let#1=\tt Nelax}}$  but this does not work too well if #1 is  $\ensuremath{\mbox{\tt Ctemp}} a-e$ .)

99 \def\renewcommand{\@star@or@long\renew@command}

#### \renew@command

```
100 \def\renew@command#1{%
101 \begingroup \escapechar\m@ne\xdef\@gtempa{{\string#1}}\endgroup
102 \expandafter\@ifundefined\@gtempa
103 {\@latex@error{\noexpand#1undefined}\@ehc}%
104 \relax
105 \let\@ifdefinable\@rc@ifdefinable
106 \new@command#1}
```

 $\@ifdefinable$ 

Test is user is allowed to define a command.

## \@@ifdefinable

```
107 \long\def\@ifdefinable #1#2{%
```

\@rc@ifdefinable

```
\edef\reserved@a{\expandafter\@gobble\string #1}%
```

```
109
        \@ifundefined\reserved@a
110
            {\edef\reserved@b{\expandafter\@carcube \reserved@a xxx\@nil}%
111
              \ifx \reserved@b\@qend \@notdefinable\else
112
                \ifx \reserved@a\@qrelax \@notdefinable\else
113
                  #2%
                \fi
114
             \fi}%
115
            \@notdefinable}
116
```

Saved definition of \@ifdefinable.

117 \let\@@ifdefinable\@ifdefinable

Version of \@ifdefinable for use with \renewcommand. Does not do the check this time, but restores the normal definition.

```
118 \long\def\@rc@ifdefinable#1#2{%
119 \let\@ifdefinable\@@ifdefinable
120 #2}
```

### \newenvironment

Define a new user environment. #1 is the environment name. #2# Grabs all the tokens up to the first {. These will be any optional arguments. They are not parsed at this point, but are just passed to \@newenv which will eventually call \newcommand. Any optional arguments will then be parsed by \newcommand as it defines the command that executes the 'begin code' of the environment.

This #2# trick removed with version 1.2i as it fails if a { occurs in the optional argument. Now use \@ifnextchar directly.

121 \def\newenvironment{\@star@or@long\new@environment}

#### \new@environment

```
122 \def\new@environment#1{%
123 \@testopt{\@newenva#1}0}
```

```
124 \def\@newenva#1[#2]{%
                          \@newenvb
                    126 \def\@newenvb#1[#2][#3]{\@newenv{#1}{[#2][{#3}]}}
                   Redefine an environment. For \renewenvironment disable \@ifdefinable and
 \renewenvironment
                    then call \newenvironment. It is OK to \let the argument to \relax here as
                    there should not be a Otemp... environment.
                    127 \def\renewenvironment{\@star@or@long\renew@environment}
\renew@environment
                    128 \def\renew@environment#1{%
                         \@ifundefined{#1}%
                    129
                            {\@latex@error{Environment #1 undefined}\@ehc
                    130
                    131
                         \expandafter\let\csname#1\endcsname\relax
                    132
                    133
                         \expandafter\let\csname end#1\endcsname\relax
                         \new@environment{#1}}
                    The internal version of \newenvironment.
          \Onewenv
                       Call \newcommand to define the \langle begin\text{-}code \rangle for the environment. \def is used
                    for the \langle end\text{-}code \rangle as it does not take arguments. (but may contain \pars)
                       Make sure that an attempt to define a 'graf' or 'group' environment fails.
                    135 \long\def\@newenv#1#2#3#4{%
                         \@ifundefined{#1}%
                    136
                           {\expandafter\let\csname#1\expandafter\endcsname
                    137
                                                 \csname end#1\endcsname}%
                    138
                    139
                    140
                         \expandafter\new@command
                             \csname #1\endcsname#2{#3}%
                    141
                            \l0ngrel0x\expandafter\def\csname end#1\endcsname{#4}}
                    142
            \newif And here's a different sort of allocation: For example, \newif\iffoo creates
                    \footrue, \foofalse to go with \iffoo.
                    143 \def\newif#1{\%}

                    150
                                            \expandafter\@gobbletwo\string#2\endcsname
                    151
                                               {\let#1#2}}
                    \providecommand takes the same arguments as \newcommand, but discards them
```

\@newenva

\providecommand

File d: ltdefns.dtx Date: 2017/03/73 Version v1.5b

if #1 is already defined, Otherwise it just acts like \newcommand. This implementation currently leaves any discarded definition in \reserved@a (and possibly \\reserved@a) this wastes a bit of space, but it will be reclaimed as soon as these scratch macros are redefined.

153 \def\providecommand{\@star@or@long\provide@command}

#### \provide@command

```
154 \def\provide@command#1{%
155 \begingroup
156 \escapechar\m@ne\xdef\@gtempa{{\string#1}}%
157 \endgroup
158 \expandafter\@ifundefined\@gtempa
159 {\def\reserved@a{\new@command#1}}%
160 {\def\reserved@a{\renew@command\reserved@a}}%
161 \reserved@a}%
```

#### \CheckCommand

\CheckCommand takes the same arguments as \newcommand. If the command already exists, with the same definition, then nothing happens, otherwise a warning is issued. Useful for checking the current state befor a macro package starts redefining things. Currently two macros are considered to have the same definition if they are the same except for different default arguments. That is, if the old definition was: \newcommand\xxx[2][a]{(#1)(#2)} then \CheckCommand\xxx[2][b]{(#1)(#2)} would not generate a warning, but, for instance \CheckCommand\xxx[2]{(#1)(#2)} would.

162 \def\CheckCommand{\@star@or@long\check@command}

\CheckCommand is only available in the preamble part of the document.

163 \@onlypreamble\CheckCommand

#### \check@command

```
164 \def\check@command#1#2#{\@check@c#1{#2}}
165 \@onlypreamble\check@command
```

#### \@check@c

\CheckCommand itself just grabs all the arguments we need, without actually looking for [ optional argument forms. Now define \reserved@a. If \\reserved@a is then defined, compare it with the "\#1' otherwise compare \reserved@a with #1.

```
166 \long\def\@check@c#1#2#3{%

167 \expandafter\let\csname\string\reserved@a\endcsname\relax

168 \renew@command\reserved@a#2{#3}%

169 \@ifundefined{\string\reserved@a}%

170 {\@check@eq#1\reserved@a}%

171 {\expandafter\@check@eq

172 \csname\string#1\expandafter\endcsname

173 \csname\string\reserved@a\endcsname}}

174 \@onlypreamble\@check@c
```

#### \@check@eq

Complain if #1 and #2 are not \ifx equal.

```

## 11.4 Robust commands and protect

Fragile and robust commands are one of the thornier issues in IATEX's commands. Whilst typesetting documents, IATEX makes use of many of TEX's features, such as arithmetic, defining macros, and setting variables. However, there are (at least) three different occasions when these commands are not safe. These are called 'moving arguments' by IATEX, and consist of:

- writing information to a file, such as indexes or tables of contents.
- writing information to the screen.
- inside an \edef, \message, \mark, or other command which evaluates its argument fully.

The method LaTeX uses for making fragile commands robust is to precede them with \protect. This can have one of five possible values:

- \relax, for normal typesetting. So \protect\foo will execute \foo.
- \string, for writing to the screen. So \protect\foo will write \foo.
- \noexpand, for writing to a file. So \protect\foo will write \foo followed by a space.
- \@unexpandable@protect, for writing a moving argument to a file. So \protect\foo will write \protect\foo followed by a space. This value is also used inside \edefs, \marks and other commands which evaluate their arguments fully.

• \@unexpandable@noexpand, for performing a deferred write inside an \edef. So \protect\foo will write \foo followed by a space. If you want \protect\foo to be written, you should use \@unexpandable@protect. (Removed as never used).

\@unexpandable@protect \@unexpandable@noexpand These commands are used for setting \protect inside \edefs.

- 194 \def\@unexpandable@protect{\noexpand\protect\noexpand}
- 195 %\def\@unexpandable@noexpand{\noexpand\noexpand\noexpand}

\DeclareRobustCommand \declare@robustcommand

This is a package-writers command, which has the same syntax as \newcommand, but which declares a protected command. It does this by having

\DeclareRobustCommand\foo

define \foo to be \protect\foo<space>,

and then use \newcommand\foo<space>.

Since the internal command is \foo<space>, when it is written to an auxiliary file, it will appear as \foo.

We have to be a bit cleverer if we're defining a short command, such as  $\_$ , in order to make sure that the auxiliary file does not include a space after the command, since  $\_$  a and  $\_$ a aren't the same. In this case we define  $\_$  to be:

```
\x@protect\_\protect\_<space>
```

which expands to:

```
\ifx\protect\@typeset@protect\else
   \@x@protect@\_
\fi
\protect\_<space>
```

Then if \protect is \@typeset@protect (normally \relax) then we just perform \\_<space>, and otherwise \@x@protect@ gobbles everything up and expands to \protect\\_.

Note: setting \protect to any value other than \relax whilst in 'typesetting' mode will cause commands to go into an infinite loop! In particular, setting \relax to \@empty will cause \\_ to loop forever. It will also break lots of other things, such as protected \ifmmodes inside \haligns. If you really really have to do such a thing, then please set \@typeset@protect to be \@empty as well. (This is what the code for \patterns does, for example.)

More fun with \expandafter and \csname.

\MakeRobust The macro firstly checks if the controls sequence in question exists at all.

Then we check if the macro is already robust. We do this by testing if the internal name for a robust macro is defined, namely  $\foo_{\sqcup}$ . If it is already defined do nothing, otherwise set  $\foo_{\sqcup}$  equal to  $\foo$  and redefine  $\foo$  so that it acts like a macro defined with  $\foo$  beclareRobustCommand.

```
\@ifundefined{\expandafter\@gobble\string#1\space}%

### 11.5 Internal defining commands

These commands are used internally to define other LATEX commands.

\@ifundefined Check if first arg is undefined or \relax and execute second or third arg depending,

```
279 \def\@ifundefined#1{%
280 \expandafter\ifx\csname#1\endcsname\relax
281 \expandafter\@firstoftwo
282 \else
283 \expandafter\@secondoftwo
284 \fi}
```

\Qqend The following define \Qqend and \Qqrelax to be the strings 'end' and 'relax' \Qqrelax with the characters \catcoded 12.

```
285 \edef\@qend{\expandafter\@cdr\string\end\@nil} 286 \edef\@qrelax{\expandafter\@cdr\string\relax\@nil}
```

\@ifnextchar

\@ifnextchar peeks at the following character and compares it with its first argument. If both are the same it executes its second argument, otherwise its third.

```
287 \long\def\@ifnextchar#1#2#3{%

288 \let\reserved@d=#1%

289 \def\reserved@a{#2}%

290 \def\reserved@b{#3}%

291 \futurelet\@let@token\@ifnch}
```

\kernel@ifnextchar

This macro is the kernel version of \@ifnextchar which is used in a couple of places to prevent the AMS variant from being used since in some places this produced chaos (for example if an fd file is loaded in a random place then the optional argument to \ProvidesFile could get printed there instead of being written only in the log file. This happened when there was a space or a newline between the mandatory and optional arguments! It should really be fixed in the amsmath package one day, but...

Note that there may be other places in the kernel where this version should be used rather than the original, but variable, version.

292 \let\kernel@ifnextchar\@ifnextchar

**\Oifnch** is a tricky macro to skip any space tokens that may appear before the character in question. If it encounters a space token, it calls xifnch.

```
293 \ensuremath{\def}\ensuremath{\def}\
     \ifx\@let@token\@sptoken
295
        \let\reserved@c\@xifnch
296
      \else
297
        \ifx\@let@token\reserved@d
           \let\reserved@c\reserved@a
298
299
           \let\reserved@c\reserved@b
300
        \fi
301
302
      \fi
      \reserved@c}
```

\@sptoken

The following code makes \@sptoken a space token. It is important here that the control sequence \: consists of a non-letter only, so that the following whitespace is significant. Together with the fact that the equal sign in a \let may be followed by only one optional space the desired effect is achieved. NOTE: the following hacking must precede the definition of \: as math medium space.

```
304 \ensuremath{\mbox{def}\:}{\ensuremath{\mbox{let}\@sptoken=}} \hbar{\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{}\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{$\mbox{
```

\@xifnch In the following definition of \@xifnch, \: is again used to get a space token as delimiter into the definition.

```
305 \def\:{\@xifnch} \expandafter\def\: {\futurelet\@let@token\@ifnch}
```

\makeatletter \makeatother

Make internal control sequences accessible or inaccessible.

```
306 \def\makeatletter{\catcode'\@11\relax} 307 \def\makeatother{\catcode'\@12\relax}
```

\@ifstar

The new implementation below avoids passing the  $\langle true\ code \rangle$  Through one more  $\langle false\ code \rangle$ , which previously meant that # had to be written as #### in one argument, but ## in the other. The \* is gobbled by  $\langle firstoftwo$ .

308 \def\@ifstar#1{\@ifnextchar \*{\@firstoftwo{#1}}}

\@dblarg

\@xdblarg

```
309 \long\def\@dblarg#1{\kernel@ifnextchar[{#1}{\cmdblarg{#1}}} \\ 310 \long\def\@xdblarg#1#2{#1[{#2}]{#2}}
```

\@sanitize

The command \@sanitize changes the catcode of all special characters except for braces to 'other'. It can be used for commands like \index that want to write their arguments verbatim. Needless to say, this command should only be executed within a group, or chaos will ensue.

```
311 \def\@sanitize{\@makeother\ \@makeother\\\@makeother\&% 312 \@makeother\*\@makeother\~\@makeother\~\
```

\@onelevel@sanitize

This makes the whole "meaning" of #1 (its one-level expansion) into catcode 12 tokens: it could be used in \DeclareRobustCommand.

If it is to be used on default float specifiers, this should be done when they are defined

```
313 \def \@onelevel@sanitize #1{%
314 \edef #1{\expandafter\strip@prefix
315 \meaning #1}%
316 }
```

## 12 Discretionary Hyphenation

\-\@dischyph

Moved here to be after the definition of \DeclareRobustCommand.

The primitive  $\$  command adds a discretionary hyphen using the current font's  $\$ hyphenchar. Monospace fonts are usually declared with  $\$ hyphenchar set to -1 to suppress hyhenation.

```
\LaTeX, from \LaTeX2.09 in 1986 defined \- by
```

```
\def\-{\discretionary{-}{}}}
```

The following comment was added when these commands were first set up, 19 April 1986:

the  $\-$  command is redefined to allow it to work in the  $\$ ttfamily type style, where automatic hyphenation is suppressed by setting  $\$ hyphenchar to -1. The original primitive  $T_EX$  definition is saved as  $\$ QQhyph just in case anyone needs it.

 $\LaTeX$  2 $_{\mathcal{E}}$ , between 1993 and 2017, had a comment at this point saying that the definition "would probably change" because the definition always uses –. The definition used below was given in comments at this point during time.

In 2017 we finally enabled this definition by default, with the older LATEX definition accessible via latexrelease as usual.

```
317 \langle 2ekernel\rangle 318 \langle 1atexrelease\rangle IncludeInRelease{2017/04/15}{\-}{Use hyphenchar in \-}%
```

Temporary definition of \@latex@info, final definition is later.

```

## 13 Counters

This section deals with counter and other variable allocation.

 $_1$   $\langle *2ekernel \rangle$ 

The following are from plain TEX:

\z@ A zero dimen or number. It's more efficient to write \parindent\z@ than \parindent Opt.

\@ne The number 1.

\mone The number -1.

\tw@ The number 2.

\sixt@n The number 16.

\@m The number 1000.

\@MM The number 20000.

\@xxxii The constant 32.

2 \chardef\@xxxii=32

\@Mi Constants 1001-1004.

\@Mii 3 \mathchardef\@Mi=10001
\@Miii 4 \mathchardef\@Mii=10002
\@miv 5 \mathchardef\@Miii=10003

 $6 \mbox{mathchardef}\Miv=10004$ 

\@tempcnta Scratch count registers used by LATEX kernel commands.

\@tempcntb 7 \newcount\@tempcnta
8 \newcount\@tempcntb

\if@tempswa General boolean switch used by LATEX kernel commands.

9 \newif\if@tempswa

\@tempdima Scratch dimen registers used by LATEX kernel commands.

\Otempboxa Scratch box register used by LATEX kernel commands.

13 \newbox\@tempboxa

\@tempskipa Scratch skip registers used by I⁴TEX kernel commands.

\@tempskipb 14 \newskip\@tempskipa

15 \newskip\@tempskipb

## 14 Program control structure

This section defines a number of control structure macros, such as while-loops and for-loops.

```
1 \langle *2ekernel \rangle
 2 \message{control,}
 \@whilenum TEST \do {BODY}
 \Owhiledim TEST \do {BODY} : These implement the loop
           while TEST do BODY od
    where TEST is a TeX \ifnum or \ifdim test, respectively.
    They are optimized for the normal case of TEST initially false.
 \Owhilesw SWITCH \fi {BODY} : Implements the loop
               while SWITCH do BODY od
    Optimized for normal case of SWITCH initially false.
\Ofor NAME := LIST \do {BODY} : Assumes that LIST expands to
A1,A2,
      ... ,An .
      Executes BODY n times, with NAME = Ai on the i-th
      Optimized for the normal case of n = 1. Works for n=0.
\Otfor NAME := LIST \do {BODY}
     if, before expansion, LIST = T1 ... Tn where each Ti is a
     token or {...}, then executes BODY n times, with NAME = Ti
     on the i-th iteration. Works for n=0.
 NOTES: 1. These macros use no \@temp sequences.
         2. These macros do not work if the body contains anything that
        looks syntactically to TeX like an improperly balanced \if
         \else \fi.
 \@whilenum TEST \do {BODY} ==
 BEGIN
   if TEST
      then BODY

## 15 Error handling

This section defines LATEX's error commands.

```
1 (*2ekernel)
```

The '2ekernel' code ensures that a \usepackage{autoerr} is essentially ignored if a 'full' format is being used that has the error messages already in the format.

These days we don't support autoloading approach any longer, but this part bit is kept in case it is used in old documents.

2 \expandafter\let\csname ver@autoerr.sty\endcsname\fmtversion

### 15.1 General commands

\MessageBreak

This command prints a new-line inside a message, followed by a continuation line begun with \@msg@continuation. Normally it is defined to be \relax, but inside messages, it is let to \@message@break.

```
3 \let\MessageBreak\relax
```

\GenericInfo

This takes two arguments: a continuation and a message, and sends the result to the log file.

```
4 \DeclareRobustCommand{\GenericInfo}[2]{%
5   \begingroup
6   \def\MessageBreak{^^J#1}%
7   \set@display@protect
8   \immediate\write\m@ne{#2\on@line.}%
9   \endgroup
10 }
```

\GenericWarning

This takes two arguments: a continuation and a message, and sends the result to the screen.

```
11 \DeclareRobustCommand{\GenericWarning}[2]{%
12  \begingroup
13  \def\MessageBreak{^^J#1}%
14  \set@display@protect
15  \immediate\write\@unused{^^J#2\on@line.^^J}%
16  \endgroup
17 }
```

\GenericError

This macro takes four arguments: a continuation, an error message, where to go for further information, and the help information. It displays the error message, and sets the error help (the result of typing h to the prompt), and does a horrible hack to turn the last context line (which by default is the only context line) into just three dots. This could be made more efficient.

```
18 \bgroup
19 \lccode'\@='\ %
```

```
20 \lccode'\"='\ %
21 \lccode'\\='\ %
22 \lccode'\\='\ %
23 \lccode'\\T='\\T%
24 \lccode'\\H='\\H%
25 \catcode'\ =11\\relax%
26 \lowercase\%
27 \egroup%
```

Unfortunately TEX versions older than 3.141 have a bug which means that ^^J does not force a linebreak in \message and \errmessage commands. So for these old TEX's we use \typeout to produce the message, and then have an empty \errmessage command. This causes an extra line of the form

! .

To appear on the terminal, but if you do not like it, you can always upgrade your TEX! In order for your format to use this version, you must define the macro \@TeXversion to be the version number, e.g., 3.14 of the underlying TEX. See the comments in ltdircheck.dtx.

```
28 \dimen@\ifx\@TeXversion\@undefined4\else\@TeXversion\fi\p@\%
29 \left( \frac{9}{14} \right)
        First the 'standard case'.

```

\PackageError
\PackageWarning
\PackageWarningNoLine
\PackageInfo
\ClassError
\ClassWarning
\ClassWarningNoLine
\ClassInfo

These commands are intended for use by package and class writers, to give information to authors. The syntax is:

```
\label{eq:condition} $$ \operatorname{\argeError}_{\langle package\rangle}_{\langle error\rangle}_{\langle help\rangle} $$ \operatorname{\argeWarning}_{\langle package\rangle}_{\langle warning\rangle} $$ \operatorname{\argeWarningNoLine}_{\langle package\rangle}_{\langle warning\rangle} $$ \operatorname{\argeInfo}_{\langle package\rangle}_{\langle info\rangle} $$
```

and similarly for classes. The Error commands print the  $\langle error \rangle$  message, and present the interactive prompt; if the author types h, then the  $\langle help \rangle$  information is displayed. The Warning commands produce a warning but do not present the interactive prompt. The WarningNoLine commands do the same, but don't print the input line number. The Info commands write the message to the log file. Within the messages, the command \MessageBreak can be used to break a line, \protect can be used to protect command names, and \space is a space, for example:

```
\newcommand{\foo}{F00}
\PackageWarning{ethel}{%
  Your hovercraft is full of eels,\MessageBreak
  and \protect\foo\space is \foo}
```

### produces:

```
Package ethel warning: Your hovercraft is full of eels, (ethel) and \foo is FOO on input line 54.
```

```

                   As well as the above error commands some error messages are directly coded
               to save space. The Messages already present in LATEX2.09 inlcuded:
```

\@parmoderr Occurs in a float environment or a \marginpar when encountered in inner vertical

Environment --- undefined

Issued by \begin for undefined environment.

tab overflow

Occurs in \= when maximum number of tabs exceeded.

\< in mid line</pre>

Occurs in \< when it appears in middle of line.

Float(s) lost

In output routine, caused by a float environment or \marginpar occurring in inner vertical mode.

### File h

# ltpar.dtx

# 16 Paragraphs

This section of the kernel declares the commands used to set \par and \everypar when ever their function needs to be changed for a long time.

# 16.1 Implementation

There are two situations in which \par may be changed:

- Long-term changes, in which the new value is to remain in effect until the current environment is left. The environments that change \par in this way are the following:
  - All list environments (itemize, quote, etc.)
  - Environments that turn \par into a noop: tabbing, array and tabular.
- Temporary changes, in which \par is restored to its previous value the next time it is executed. The following are all such uses.
  - \end when preceded by \@endparenv, which is called by \endtrivlist
  - The mechanism for avoiding page breaks and getting the spacing right after section heads.

\@setpar

To permit the proper interaction of these two situations, long-term changes are made by the  $\ensuremath{\mbox{\tt Qsetpar}}\{\langle VAL\rangle\}$  command. It's function is:

To set \par. It \def's \par and \@par to  $\langle VAL \rangle$ .

\@restorepar

Short-term changes are made by the usual \def\par commands. The original values are restored after a short-term change by the \@restorepar commands.

\@@par always is defined to be the original TFX \par.

\@@par \everypar

\everypar is changed only for the short term. Whenever \everypar is set non-null, it should restore itself to null when executed.

The following commands change \everypar in this way:

- \item
- \end when preceded by \@endparenv, which is called by endtrivlist
- \minipage

When dealing with \par and \everypar remember the following two warnings:

1. Commands that make short-term changes to \par and \everypar must take account of the possibility that the new commands and the ones that do the restoration may be executed inside a group. In particular, \everypar is executed inside a group whenever a new paragraph begins with a left brace. The \everypar command that restores its definition should be local to the current group (in case the command is inside a minipage used inside someplace).

File h: ltpar.dtx Date: 1995/04/29 Version v1.1c

where \everypar has been redefined). Thus, if \everypar is redefined to do an \everypar{} it could take several executions of \everypar before the restoration "holds". This usually causes no problem. However, to prevent the extra executions from doing harm, use a global switch to keep anything harmful in the new \everypar from being done twice.

- 2. Commands that change \everypar should remember that \everypar might be supposed to set the following switches false:
  - @nobreak
  - @minipage

they should do the setting if necessary.

- $_1$   $\langle *2ekernel \rangle$
- 2 \message{par,}

\@setpar Initiate a long-term change to \par.

\@par

 $\label{lem:condition} $$ \def\@par{#1}\def\@par{#1}} $$$ 

The default definition of \@par will ensure that if \@restorepar defines \par to execute \@par it will redefine itself to the primitive \@@par after one iteration.

- 4 \def\@par{\let\par\@@par\par}
- $5 \langle /2ekernel \rangle$

\@restorepar Restore from a short-term change to \par.

6 \def\@restorepar{\def\par{\@par}}

### File i

# ltspace.dtx

# 17 Spacing

This section deals with spacing, and line- and page-breaking.

### 17.1 User Commands

```
[\langle i \rangle] : \langle i \rangle = 0,...,4.
\nopagebreak
                                                            Default argument = 4. Puts a penalty into the vertical list output as follows:
                                                 0: penalty = 0
                                                 1: penalty = \@lowpenalty
                                                 2: penalty = \ensuremath{\texttt{Qmedpenalty}}
                                                 3: penalty = \qbelownerse \qb

                                                            \[\langle length \rangle\]: initially defined to be \ \newline
                                                 Note: \\* adds a \vadjust{\penalty 10000}
                                                            OBSOLETE COMMANDS (which never made it into the manual):
                                                            \obeycr : defines ¡CR; == \\relax
                                                 \restorecr : restores ¡CR; to its usual meaning.
```

# 17.2 Chris' comments

There are several aspects of the handling of space in horizontal mode that are inconsistent or do not work well in some cases. These are largely concerned with ignoring the effect of space tokens that would otherwise typeset an inter-word space.

Negating the effect of such space tokens is achieved by two mechanisms:

- \unskip is used to remove the glue just added by a space that has already had its effect; it is sometimes invoked after an \ifdim test on \lastskip (see below);
- \ignorespaces is used to ignore space-tokens yet to come.

The test done on \lastskip is sometimes for equality with zero and sometimes for being positive. Recall also that the test is only on the natural length of the glue and that no glue cannot be distinguished from glue whose natural length is zero: to summarise, a pretty awful test. It is not clear why these tests are not all the same; I think that they should all be for equality. One place where \unskip is often used is just before a \par (which itself internally does an \unskip) and one bit of code (in \@item) even has two \unskips before a \par. These uses may be fossil code but if they are necessary, maybe \@killglue would be even safer.

Such removal of glue by \unskip may sometimes have the wrong result, removing not the glue from a space-token but other explicit glue; this is sometimes not what is intended.

A common way to prevent such removal is to add an \hskip\z@ after the glue that should not be removed. This protects that glue against one \unskip with no test but not against more than one. It does work for 'tested \unskips'. This is used by \hspace\* but not by \hspace; this is inconsistent as the star is supposed to prevent removal only at the beginning of a line, not at the end, or in a tabular, etc.

If this reason for removing glue were the only consideration then a tested-\unskip and protection by \hskip\z@ would suffice but would need to be consistently implemented.

However, the class of invisibles, commands and environments tries to be even cleverer: one of these tries to leave only one inter-word space whenever there is one before it and one after it; and it does this quite well.

But problems can arise when there is not a space-token on both sides of it; in particular, when an invisible appears at the beginning or end of a piece of text the method still leaves one space token whereas usually in these cases it should leave none

Also, the current rules do not work well when more than one such command appears consecutively, separated by space-tokens; it leaves glue between every other invisible.

There is also a question about what these commands should do when they occur next to spaces that do not come from space tokens but, for example, from \hspace. Should they still produce 'just one space'? If so, which one? It is good to note that the manual is sufficiently cautious about invisibles that we are not obliged to make anything work.

Another interesting side-road to explore is whether the space-tokens either side of an \hspace{...} should be ignored.

One alternative to the current algorithm that is often suggested is that all glue around the invisible should be consolidated into a space after it (usually without stating how much glue should be put there). The command \nolinebreak is implemented this way (and \linebreak should also be). This does not work correctly for the following common case:

```
... some text
\index{some-word}
some-word and more text.
```

This is optimal coding since it is normal to index a word that gets split across a page-break on its starting page. This would, on the other hand, fix another common (and documented) failure of the current system: when the invisible is

the last thing in a paragraph the space before it is not removed and, worse, it is also hidden from the paragraph-ending mechanism so that an 'empty' line can be created at the end of the paragraph.

Another deficiency (I think) of the current system is that the following is treated as having the \index command between the paragraphs, which is probably not what the author intended (since there is no empty line after it).

```
\index{beginnings}
Beginnings of paragraphs ...
```

I know of no algorithm that will handle satisfactorily even all the most common cases; note that it could be that the best algorithm may be different for different invisibles since, for example, the common uses and expected behaviour of \index, \marginpar, \linebreak, \pagebreak and \vspace are somewhat different. [For example, is \vspace ever used in the middle of a paragraph?]

One method that can (and is) used to make invisible commands produce no space when used at the beginning of text is to put in some glue that is nearly enough the same as no glue or glue of zero length in all respects except for the precise test for not being exactly equal to zero; examples of such glue are \hskip 1sp and, possibly better but more complex, \hskip -1sp \hskip 1sp. However, this only works when it is known that user-supplied text is about to start.

Some similar concerns apply to the handling of space and penalties in vertical mode; there is an extra hurdle here as \unskip does not work on the main vertical list. The complexity of the tests done by \addvspace have never been explained.

The implementation of space hacks etc for vertical mode is another major area that needs further attention; my earlier experiments did not produce much improvement over the current unsatisfactory situation.

One particular problem is what happens when the following very natural coding is used (part of the problem here is that this looks like an hmode problem, but it is not):

```
... end of text.
\begin{enumerate}
  \item \label{item:xxx} Item text.
\end{enumerate}
```

### 17.3 Some immediate actions

- Fix bug in \linebreak.
- Fix bug in \\\*.
- Reimplement \\, etc, removing extra \vadjusts and getting better error trapping (this seems to involve a lot more tokens).
- Investigate whether \\, etc need to be errors in vmode; I think that they could be noops (maybe with a warning).
- Make all(?) \unskips include test for zero skip (rather than other tests or no test).

- Consider replacing \hskip 1sp by something better (here called an 'infinitesimal' skip).
- Look at all \hskip\z@ (or similar) to see if they should be changed to an 'infinitesimal' skip.
- Resolve the inconsistency between \hspace and \hspace\*.
- Remove unnecessary \unskips.
- Investigate and rationalise the 'newline' code.
- Find better algorithms for all sorts of things or, easier(?), fix TEX itself.

### 17.4 The code

```
1 \langle *2ekernel \rangle
                                                                  2 \message{spacing,}
        \pagebreak
\nopagebreak
                                                                 3 \def\pagebreak{\@testopt{\@no@pgbk-}4}
                                                                 4 \def\nopagebreak{\@testopt\@no@pgbk4}
            \@no@pgbk
                                                                 5 \ensuremath{\mbox{\sc def}\mbox{\sc def}
                                                                               \ifvmode
                                                                 6
                                                                                        \penalty #1\@getpen{#2}%
                                                                 7
                                                                                 \else
                                                                 8
                                                                                         \@bsphack
                                                                 9
                                                                                         \vadjust{\penalty #1\@getpen{#2}}%
                                                               10
                                                               11
                                                                                        \@esphack

\\ The purpose of the new code is to fix a few bugs; however, it also attempts to optimize the following, in order of priority:

- 1. efficient execution of plain \\;
- 2. efficient execution of  $\[ \dots \]$ ;
- 3. memory use;

34

4. name-space use.

The changes should make no difference to the typeset output. It appears to be safe to use \reserved@e and \reserved@f here (other reserved macros are somewhat disastrous).

These changes made \newline even less robust than it had been, so now it is explicitly robust, like \\.

The internal definition of the 'normal' definition of \\. \@normalcr

```
35 \DeclareRobustCommand\\{%
    \let \reserved@e \relax
36
    \let \reserved@f \relax
37
    \@ifstar{\let \reserved@e \vadjust \let \reserved@f \nobreak
38
                \@xnewline}%
39
            \@xnewline}
40
41 \expandafter\let\expandafter\@normalcr
42
       \csname\expandafter\@gobble\string\\ \endcsname
```

\newline A simple form of the 'normal' definition of \\.

43 \DeclareRobustCommand\newline{\@normalcr\relax}

\@xnewline

```
44 \def\@xnewline{\@ifnextchar[% ] bracket matching
                    \@newline
                    {\@gnewline\relax}}
46
```

\@newline

```
47 \def\@newline[#1]{\let \reserved@e \vadjust

\if@nobreak

Switch used to avoid page breaks caused by \label after a section heading, etc. It should be **GLOBALLY** set true after the \nobreak and **globally** set false by the next invocation of \everypar.

Commands that reset \everypar should globally set it false if appropriate.

```
58 \def\@nobreakfalse{\global\let\if@nobreak\iffalse} 
59 \def\@nobreaktrue {\global\let\if@nobreak\iftrue}
```

60 \@nobreakfalse

\@savsk

Registers used to save the space factor and last skip.

\@savsf

- $61 \newdimen\0savsk$
- 62 \newcount\@savsf

\@bsphack

\Obsphack and \Oesphack used by macros such as \index and \begin{Offloat} ....\end{Offloat} that want to be invisible — i.e., not leave any extra space when used in the middle of text. Such a macro should begin with \Obsphack and end with \Oesphack The macro in question should not create any text, nor change the mode

Before giving the current definition we give an extended definition that is currently not used (because it doesn't work as advertised:-)

These are generalised hacks which attempt to do sensible things when 'invisible commands' appear in vmode too.

They need to cope with space in both hmode (plus spacefactor) and vmode, and also cope with breaks etc. In vmode this means ensuring that any following \addvspace, etc sees the correct glue in \lastskip.

In fact, these improved versions should be used for other cases of 'whatsits, thingies etc' which should be invisible. They are only for commands, not environments (see notes on \@Esphack).

BTW, anyone know why the standard hacks are surrounded by \ifmmode\else rather than simply \ifhmode?

And are there any cases where saving the spacefactor is essential? I have some extensions where it is, but it does not appear to be so in the standard uses.

```
\def \@bsphack{%
  \relax \ifvmode
  \@savsk \lastskip
  \ifdim \lastskip=\z@
  \else
    \vskip -\lastskip
  \fi
  \else
    \ifhmode
    \@savsk \lastskip
    \@savsf \spacefactor
  \fi
  \fi
}
```

I think that, in vmode, it is the safest to put in a \nobreak immediately after such things since writes, inserts etc followed by glue give valid breakpoints and, in general, it is possible to create breaks but impossible to destroy them.

```
\def \@esphack{%
                \relax \ifvmode
                  \nobreak
                  \ifdim \@savsk=\z@
                  \else
                    \vskip\@savsk
                  \fi
                \else
                  \ifhmode
                    \spacefactor \@savsf
                    \ifdim \@savsk>\z@
                       \ignorespaces

\@vbsphack Another variant which is useful for invisible things which should not live in vmode (this is how some people feel about marginals).

If it occurs in vmode then it enters hmode and ensures that \@savsk is nonzero so that the \ignorespaces is put in later. It is not used at present.

```
\def \@vbsphack{ %
  \relax \ifvmode
  \leavevmode
  \@savsk 1sp
  \@savsf \spacefactor
  \else
    \ifhmode
    \@savsk \lastskip
    \@savsf \spacefactor
  \fi
  \fi
}
```

### 17.5 Vertical spacing

LATEX supports the plain TeX commands \smallskip, \medskip and \bigskip. However, it redefines them using \vspace instead of \vskip.

Extra vertical space is added by the command  $\addvspace{\langle skip \rangle}$ , which adds a vertical skip of  $\langle skip \rangle$  to the document. The sequence

```
\addvspace{\langle s1 \rangle} \addvspace{\langle s2 \rangle} is equivalent to \addvspace{\langle maximum\ of\ s1,\ s2 \rangle}.
```

\addvspace should be used only in vertical mode, and gives an error if it's not. The \addvspace command does *not* add vertical space if @minipage is true. The minipage environment uses this to inhibit the addition of extra vertical space at the beginning.

Penalties are put into the vertical list with the  $\addpenalty{\langle penalty\rangle}$  command. It works properly when  $\addpenalty$  and  $\addvspace$  commands are mixed.

The **@nobreak** switch is set true used when in vertical mode and no page break should occur. (Right now, it is used only by the section heading commands to inhibit page breaking after a heading.)

```
\addvspace{SKIP} ==
BEGIN
  if vmode
    then if @minipage
           else if \lastskip =0
                   then \vskip SKIP
                   else if \lastskip < SKIP
                             then \vskip -\lastskip
                                   \vskip SKIP
                             else if SKIP < 0 and \label{eq:skip} >= 0
                                    then \vskip -\lastskip
                                         \vskip \lastskip + SKIP
         fi
                 fi
                           fi
                                   fi
    else useful error message (CAR).
  fi
END
```

\@xaddvskip Internal macro for \vspace handling the case that space has previously been added.

              Fix provided by Donald (though the original fix was not good enough). In 2005
              Plamen Tanovski discovered that this fix wasn't good enough either as the \vskip
              kept getting bigger if several \addpenalty commands followed each other. Donald
              kindly send a new fix.
              170 \def\addpenalty#1{%

# 17.6 Horizontal space (and breaks)

\nobreakdashes

This idea is borrowed from the amsmath package but here we define a robust command.

This command is a low-level command designed for use only before hyphens or dashes (such as -, --, or ---).

It could probably be better implemented: it may need its own private token register and temporary command.

Setting the hyphen in a box and then unboxing it means that the normal penalty will not be added after it—and if the penalty is not there a break will not be taken (unless an explicit penalty or glue follows, thus the final \nobreak).

Note that even if it is not followed by a '-', it still leaves vmode and sets the spacefactor; so use it carefully!

```
262 \DeclareRobustCommand{\nobreakdashes}{%
    \leavevmode
263
    \toks@{}%
264
    265
                     \futurelet\@let@token \reserved@b}%
266
    \def\reserved@b
                    {\ifx\@let@token -%
267
                        \expandafter\reserved@a
268
269
                       \setbox\z@ \hbox{\the\toks@\nobreak}%
270
                       271
272
                       \spacefactor\sfcode'\-
273
                     \fi}%
    \futurelet\@let@token \reserved@b
274
275 }
```

# \nobreakspace \@xobeysp

This is a robust command that produces a horizontal space at which, in paragraph-mode, a line-break is not possible. We then define an active ~ to expand to it since this is the documented behaviour of ~. One reason for introducing this is that some 8-bit input encodings have a slot for such a space and we do not want to use active characters as the LATEX internal commands.

The braces in the definition of ~ are needed to ensure that a following space is preserved when reading to/from internal files.

We need to keep  $\colon problem 2000 \colon p$ 

```
276 \DeclareRobustCommand{\nobreakspace}{%
277 \leavevmode\nobreak\}
278 \catcode '\~=13
279 \def~{\nobreakspace{}}
280 \expandafter\let\expandafter\@xobeysp\csname nobreakspace \endcsname
```

\, Used in paragraph mode produces a \thinspace. It has the ordinary definition in math mode. Useful for quotes inside quotes, as in ''\,'Foo', he said.''

```
281 \DeclareRobustCommand{\,}{%
282 \relax\ifnmode\mskip\thinmuskip\else\thinspace\fi
283 }
```

\@ Placed before a '.', makes it a sentence-ending period. Does the right thing for other punctuation marks as well. Does this by setting spacefactor to 1000.

File i: ltspace.dtx Date: 2016/07/04 Version v1.3g

## File k

# ltfiles.dtx

# 19 File Handling

The following user commands are defined in this part:

\document (ie \begin{document})

Reads in the .AUX files and \catcode's @ to 12.

\nofiles

Suppresses all file output by setting \Ofilesw false.

\includeonly

 $\{\langle NAME1, \dots, NAMEn \rangle\}$ 

Causes only parts NAME1, ... , NAMEn to be read by their \include commands. Works by setting parts w true and setting \@partlist to NAME1, ... , NAMEn.

\include  $\{\langle NAME \rangle\}$ 

Does an \input NAME unless \@partsw is true and NAME is not in \@partlist. If \@filesw is true, then it directs .AUX output to NAME.AUX, including a checkpoint at the end.

\input

 $\{\langle NAME \rangle\}$ 

The same as TeX's \input, except it allows optional braces around the file name. In  $\LaTeX$   $2_{\varepsilon}$ , it also avoids the primitive 'missing file' error, if the file can not be found.

\IfFileExists

 ${\langle NAME \rangle} {\langle then \rangle} {\langle else \rangle}$ 

If the file exists on the system, execute then otherwise execute else.

\InputIfFileExists

 ${\langle NAME \rangle} {\langle then \rangle} {\langle else \rangle}$  If the file exists on the system, execute *then* and input *NAME* otherwise execute *else*.

1 (\*2ekernel)

2 \message{files,}

VARIABLES, SWITCHES AND INTERNAL COMMANDS:

\@mainaux : Output file number for main .AUX file.

\Quantaux : Output file number for current part's .AUX file. \Quantauxout : Either \Quantout or \Quantout, depending on

which .AUX file output goes to.

\@input{foo} : If file foo exists, then \input's it,

otherwise types a warning message.

@filesw : Switch - set false if no .AUX, .TOC, .IDX etc

files are to be written

@partsw : Set true by a \includeonly command.

\@partlist : Set to the argument of the \includeonly command.

\cp@FOO : The checkpoint for \include'd file FOO.TEX, written

by \@writeckpt at the end of file FOO.AUX

37 \fi
```

Dateline 1991/03/26: FMi added \process@table to support NFSS; This will also work with old lfonts if no other style defines \process@table. The following line forces the initialization of the math fonts.

```
38 \process@table
39 \let\glb@currsize\@empty %% Force math initialization.
40 \normalsize
41 \everypar{}%
```

So that punctuation in headings is not disturbed by verbatim or other local changes to the space factor codes, save the document default here. This will be locally reset by the output routine. For special cases a class may want to define \normalsfcodes directly, in case that definition will be used. (This is an old bug, problem existed in LATEX2.0x and plain TEX.)

```
42 \ifx\normalsfcodes\@empty
43 \ifnum\sfcode'\.=\@m
44 \let\normalsfcodes\frenchspacing
45 \else
46 \let\normalsfcodes\nonfrenchspacing
47 \fi
48 \fi
```

For similar reasons also save the default language, this will be reset locally in the output routine. In particular it allows hyphenation in the page head even if the page break happens in verbatim. If this has already been set by a package, set to the value of \language at this spoint.

```
49 \ifx\document@default@language\m@ne
50 \chardef\document@default@language\language
51 \fi
```

Way back in 1991 (08/26) FMi & RmS set the \@noskipsec switch to true in the preamble and to false here. This was done to trap lists and related text in the preamble but it does not catch everything; hence Change 1.1g was introduced.

```
52 \@noskipsecfalse
```

#### 53 \let \@refundefined \relax

Just before disabling the preamble commands we execute the begin document hook which contains any code contributed by \AtBeginDocument. Also disable the gathering of the file list, if no \listfiles has been issued. \AtBeginDocument is redefined at this point so that and such commands that get into the hook do not chase their tail...

```
54 \let\AtBeginDocument\@firstofone
```

55 \@begindocumenthook

Most of the following assignments will be done globally in case the user adds something like \begin{multicols} to the document hook, i.e. starts are group in \begin{document}.

Since a value of exactly 0pt for \topskip causes \twocolumn[] to misbehave, we add this check, hoping that it will not cause any problems elsewhere.

```
56 \ifdim\topskip<1sp\global\topskip 1sp\relax\fi
57 \global\@maxdepth\maxdepth
58 \global\let\@begindocumenthook\@undefined
59 \ifx\@listfiles\@undefined
60 \global\let\@filelist\relax
61 \global\let\@addtofilelist\@gobble
62 \fi</pre>
```

At the very end we disable all preamble commands. This has to happen after the begin document hooks was executed so that this hook can still use such commands.

```
63 \gdef\do##1{\global\let ##1\@notprerr}%
64 \@preamblecmds
```

The next line saves tokens and also allows \@nodocument to be used directly to trap preamble errors.

```
65 \global\let \@nodocument \relax
```

The next line is a pure safety measure in case a do list is ever expanded at the wrong place. In addition it will save a few tokens to get rid of the above definition.

#### 66 \global\let\do\noexpand

Use of \AtBeginDocument hook might mean that we are already in horizontal mode, so ignore the space after \begin{document}.

 $124 \ensuremath{\mbox{\tt Qonlypreamble}\mbox{\tt document}}$ 

\normalsfcodes

The setting of \@empty is just a flag. This command may be defined in a class or package file. If it is still \@empty at \begin{document} it will be defined to be \frenchspacing or \nonfrenchspacing, depending on which of those appears to be in effect at that point.

125 \let\normalsfcodes\@empty

\nofiles

Set \@fileswfalse which suppresses the places where IATEX makes \immediate writes. The \makeindex and \makeglossary are disabled. \protected@write is redefined not to write to the file specified, but rather to write a blank line to the log file. This ensures that a  $\langle whatsit \rangle$  node is still created, and so spacing is not affected by the \nofiles command; to ensure this more generally, the \if@nobreak test is needed.

```
126 \def\nofiles{%
127 \@fileswfalse
128 \typeout{No auxiliary output files.^^J}%
129 \long\def\protected@write##1##2##3%

131 \let\makeindex\relax
132 \let\makeglossary\relax}
133 \@onlypreamble\nofiles
```

\protected@write

This takes three arguments: an output stream, some initialization code, and some text to write. It then writes this, with appropriate handling of \protect and

```
\thepage.
              134 \long\def \protected@write#1#2#3{%

              148 \@onlypreamble\includeonly
              In the definition of \include, \def\reserved@b changed to \edef\reserved@b
    \include
              to be consistent with the \edef in \includeonly. (Suggested by Rainer Schöpf
              & Frank Mittelbach. Change made 20 Jul 88.)
                 Changed definition of \include to allow space at end of file name — otherwise,
              typing \include{foo} would cause LATEX to overwrite foo.tex. Change made
              24 May 89, suggested by Rainer Schöpf and Frank Mittelbach
                 Made \include check for being used inside an \include'd file, as this will not
              work and cause surprising results.

### File 1

# ltoutenc.dtx

# 20 Font encodings

This section of the kernel contains commands for declaring encoding-specific commands, such as accents. It also contains the code for some of the encoding files, including omlenc.def, omsenc.def, tlenc.def and otlenc.def files, which define the OLM, OMS, T1 and OT1 encodings, and the fontenc package for selecting encodings.

The fontenc package has options for encodings, of which the last option is the default encoding. For example, to use the OT2, OT3 and T1 encodings, with T1 as the default, you say:

```
\usepackage[OT2,OT3,T1]{fontenc}
```

The standard kernel set-up loads font encoding files and selects an encoding as follows.

```
\input {omlenc.def}
\input {t1enc.def}
\input {ot1enc.def}
\input {omsenc.def}
\fontencoding{OT1}
```

Note that the files in the standard inputenc package depend on this behaviour of the kernel.

The syntax for declaring encoding-specific commands is:

This command is like \newcommand, except that it defines a command which is specific to one encoding. The resulting command is always robust, even if its definition is fragile. For example, the definition of \1 in the OT1 encoding is:

```
\DeclareTextCommand{\l}{OT1}{{\@xxxii l}}
```

\DeclareTextCommand takes the same optional arguments as \newcommand.

```
\label{eq:command} $$ \Pr \operatorname{Command}_{\langle command \rangle}_{\langle encoding \rangle} $$ $$ [\langle number \rangle] [\langle default \rangle]_{\langle commands \rangle}_{\langle encoding \rangle}_{\langle encoding
```

This acts like \DeclareTextCommand, but does nothing if the command is already defined.

This command defines a text symbol, with a particular slot in that encoding. The commands:

```
\DeclareTextSymbol{\ss}{0T1}{25}
\DeclareTextCommand{\ss}{0T1}{\char25 }
```

have the same effect, but the \DeclareTextSymbol is faster.

This command declares a text accent. The commands:

```
\DeclareTextAccent{\"}{0T1}{127}
\DeclareTextCommand{\"}{0T1}{\add@accent {127}}
```

have the same effect.

```
\label{eq:command} $$ \ \ {\langle command \rangle} = {\langle encoding \rangle} {\langle argument \rangle} {\langle slot \rangle} $$
```

This command declares a composite letter, for example in the T1 encoding \'{a} is slot 225, which is declared by:

```
\DeclareTextComposite{\'}{T1}{a}{225}
```

The *command* will normally have been declared with \DeclareTextAccent, or as a one-argument \DeclareTextCommand.

\DeclareTextComposite is the most common example of using the more general declaration \DeclareTextCompositeCommand, which can define a composite to be an arbitrary piece of text.

```
\label{localized} $$ \ \ \ \ {\command} {\
```

For example, in the OT1 encoding Å has a hand-crafted definition this is declared as follows

```
\DeclareTextCompositeCommand{\r}{OT1}{A} {\leavevmode\setbox\z@\hbox{!}\dimen@\ht\z@\advance\dimen@-1ex% \rlap{\raise.67\dimen@\hbox{\char23}}A}
```

The *command* will normally have been declared with \DeclareTextAccent, or as a one-argument \DeclareTextCommand.

The commands defined using the above declarations can be used in two ways. Normally they are used by just calling the command in the appropriate encoding, for example \ss. However, sometimes you may wish to use a command in an encoding where it is not defined. If the command has no arguments, then you can use it in another encoding by calling \UseTextSymbol:

```
\verb|\UseTextSymbol|{|\langle encoding\rangle|}{|\langle command\rangle|}
```

For example, \UseTextSymbol{OT1}{\ss} has the same effect as:

```
{\tt \{\fontencoding\{0T1\}\selectfont\ss\}}
```

If the command has one argument then you can use it in another encoding by calling  $\UseTextAccent$ :

```
\UseTextAccent{\langle encoding \rangle}{\langle command \rangle}{\langle text \rangle}
```

For example, if the current encoding is OT2 then  $\UseTextAccent{OT1}{\'}{a}$  has the same effect as:

```
{\fontencoding{OT1}\selectfont\'{\fontencoding{OT2}\selectfont a}}
```

You can also declare a default definition for a text command, which will be used if the current encoding has no appropriate definition. Such use will also set the definition for this command in the current encoding to equal this default definition; this makes subsequent uses of the command much faster.

```
\DeclareTextCommandDefault\{\langle command \rangle\}\{\langle definition \rangle\}
```

For example, the default definition of the command \textonequarter (which produces the fraction  $\frac{1}{4}$ ) could be built using math mode:

```
\DeclareTextCommandDefault{\textonequarter}{\ensuremath {\frac14}}
```

There is a matching **\Provide** command which will not override an existing default definition:

```
\verb|\ProvideTextCommandDefault{|} \langle command \rangle \} \{ \langle definition \rangle \}
```

The most common use for these commands is to use symbols from other encodings, so there are some optimizations provided:

are short for:

For example, to make OT1 the default encoding for \ss and \' you say:

```
\DeclareTextSymbolDefault{\ss}{0T1}
\DeclareTextAccentDefault{\','}{0T1}
```

Note that you can use these commands on any zero- or one-argument commands declared with \DeclareText\* or \ProvideText\*, not just those defined using \DeclareTextSymbol or \DeclareTextAccent.

### 20.1 Removing encoding-specific commands

In some cases encoding definitions are given to provide some limited support since nothing better is available, for example, the definition for <page-header> is a hack since \$ and  $\pounds$  actually share the same slot in this encoding. Thus if such a glyph becomes available in a different encoding (e.g., TS1) one would like to get rid of the flacky one and make the default definition point to the new encoding. In such a case defining

```
\DeclareTextSymbol{\textdollar}{TS1}{36} \DeclareTextSymbolDefault{\textdollar}{TS1}
```

is not enough since if type setting in OT1 LATEX will still find the encoding specific-definition for OT1 and therefore ignore the new default. Therefore to ensure that in this case the TS1 version is used we have to remove the OT1 declaration:

```
\UndeclareTextCommand{\textdollar}{OT1}
```

Since the \$ sign is a proper glyph in the T1 encoding there is no point removing its definition and forcing IATEX to pick up the TS1 version if typesetting in this encoding. However, assume you want to use the variant dollar sign, i.e., \$ for your dollars. In that case you have to get rid of the T1 declaration as well, e.g., the following would do that for you:

### 20.2 The order of declarations

If an encoding-specific command is defined for more than one encoding, then it will execute fastest in the encoding in which it was defined last since its top-level definition will be set up to execute in that encoding without any overhead.

For this reason the file fonttext.ltx currently first loads the definitions for the T1 encoding and then those for the OT1 encoding so that typesetting in OT1 is optimized since that is (still) the default. However, when T1 is explicitly requested (via \usepackage[T1]{fontenc}) the top-level definitions are automatically changed to favour T1 since its declarations are reloaded in the process.

For the same reason default declarations should never come last since they are implemented as a special encoding themselves (with the name?). Specifying them last would simply mean to make those encoding-specific commands equally inefficient in all encodings. Therefore the textcomp package, for example, first sets up all defaults to point to TS1 and then declares the commands in the TS1 encoding.

### 20.3 Docstrip modules

This .dtx file is be used to generate several related files containing font encoding definitions. The mutually exclusive docstrip options are listed here.

T1 TS1	generates t1enc.def for the Cork encoding. generates ts1enc.def for the Text Companion encoding.
TS1sty	generates textcomp.sty, package that sets up use of the Text
-	Companion encoding.
OT1	generates otlenc.def for Knuth's CM encoding.
OMS	generates omsenc.def for Knuth's math symbol encoding.
OML	generates omlenc.def for Knuth's math letters encoding.
OT4	generates ot4enc.def for the Polish extension to the OT1 encod-
	ing, created by B. Jackowski and M. Ryćko for use with the Polish
	version of Computer Modern and Computer Concrete.
TU	generates tuenc.def for Unicode font encoding.
package	generates fontenc.sty for selecting encodings.
2ekernel	for the kernel commands.

### 20.4 Definitions for the kernel

#### 20.4.1 Declaration commands

This section contains definitions for commands such as accents which depend on the current encoding. These commands will usually be kept in .def files, for example otlenc.def contains the definitions for the OT1 encoding.

```
1 (*2ekernel)
2 \message{font encodings,}
Far too many macros in one block here!
```

\DeclareTextCommand
\ProvideTextCommand
\DeclareTextSymbol
\@dec@text@cmd
\chardef@text@cmd
\@changed@cmd
\@changed@x
\TextSymbolUnavailable
\@inmathwarn

```
\DeclareTextCommand{\foo}{T1}...
```

If you say:

then  $\foo$  is defined to be  $\T1-\cond$   $\foo$   $\T1\foo$ , where  $\T1\foo$  is one control sequence, not two! We then call  $\new$ command to define  $\T1\foo$ .

```
3 \def\DeclareTextCommand{%
     \@dec@text@cmd\newcommand}
5 \def\ProvideTextCommand{%
     \@dec@text@cmd\providecommand}
7 \def\@dec@text@cmd#1#2#3{%
     \expandafter\def\expandafter#2%
9
        \expandafter{%
10
           \csname#3-cmd\expandafter\endcsname
11
           \expandafter#2%
            \csname#3\string#2\endcsname
12
        }%
13
     \let\@ifdefinable\@rc@ifdefinable
14
     \expandafter#1\csname#3\string#2\endcsname}
15
```

This command was introduced to fix a major bug in \@dec@text@cmd without changing that command itself. This was thought to be necessary because it is defined in more than one package. (Perhaps the more serious bug is to put complex low-level commands like this in packages?)

The problem it solves is that whereas both \newcommand and \providecommand (used just above) both handle the resetting of \@ifdefinable (following its disabling in \@dec@text@cmd), the primitive \chardef neither needs the disabling, nor does the resetting.

```
16 \def\chardef@text@cmd{%
17  \let\@ifdefinable\@@ifdefinable
18  \chardef
19  }
20 \def\DeclareTextSymbol#1#2#3{%
21  \@dec@text@cmd\chardef@text@cmd#1{#2}#3\relax
22  }
```

The declarations are only available before \begin{document}.

```
23 \verb|\Conlypreamble\DeclareTextCommand|\\
```

 $24 \verb|\Qonlypreamble\DeclareTextSymbol|$ 

The sneaky bit in all this is what  $\T1-cmd \foo \T1\foo does$ . There are five possibilities, depending on the current values of  $\protect$ ,  $\cf@encoding$  and  $\foo \T1\foo does$ .

- If \protect is \@typeset@protect and \cf@encoding is T1, then we execute \T1\foo. This should be the normal behaviour, and is optimized for speed.
- If \protect is \@typeset@protect, \cf@encoding is (say) OT1, and \OT1\foo is defined, then we execute \OT1\foo.
- If \protect is \@typeset@protect, \cf@encoding is (say) OT1, we're in text mode, and \OT1\foo is undefined, then we define \OT1\foo to be the default value of \foo, and execute \OT1\foo.
- If \protect is \@typeset@protect, \cf@encoding is (say) OT1, we're in math mode, and \OT1\foo is undefined, then we execute the default value of \foo. (This is necessary so that things like \$X\_\copyright\$ work properly.)
- If \protect is not \@typeset@protect then we execute \noexpand\foo. For example, if we are writing to a file, then this results in \foo being written. If we are in a \mark, then \foo will be put in the mark—since \foo is robust, it will then survive all the things which may happen to it whilst it's a \mark.

So after all that, we will either execute the appropriate definition of \foo for the current encoding, or we will execute \noexpand\foo.

The default value of **\foo** is **\?\foo** if it is defined, and an error message otherwise.

When the encoding is changed from T1 to OT1, \T1-cmd is defined to be \@changed@cmd and \OT1-cmd is defined to be \@current@cmd. This means that the test for what the current encoding is can be performed quickly.

```
25 \def\@current@cmd#1{%
     \ifx\protect\@typeset@protect
26
        \@inmathwarn#1%
27
     \else

44
            \expandafter\endcsname
45
     \else
46
         \noexpand#1%
47
48
     \fi}
```

File l: ltoutenc.dtx Date: 2017/04/05 Version v2.0i

49 \gdef\TextSymbolUnavailable#1{%

```
50 \ClatexCerror{%
51 Command \protect#1 unavailable in encoding \cfCencoding%
52 }\Cena}
```

The command \@inmathwarn produces a warning message if we are currently in math mode. Note that since this command is used inside text commands, it can't call \relax before the \ifmmode. This means that it is possible for the warning to fail to be issued at the beginning of a row of an halign whose template enters math mode. This is probably a bad feature, but there's not much that can be done about it, since adding a \relax would break ligatures and kerning between text symbols.

A more efficient solution would be to make \@inmathwarn and \@inmatherr equal to \@empty and \relax by default, and to have \everymath reset them to their usual definitions. This is left for future investigation (for example it may break some third party code).

```
53 \def\@inmathwarn#1{%

54 \ifmmode

55 \@latex@warning{Command \protect#1 invalid in math mode}%

56 \fi}
```

#### \DeclareTextCommandDefault \ProvideTextCommandDefault

These define commands with encoding?.

Note that \DeclareTextCommandDefault can only be used in the preamble, but that the \Provide version is allowed in inputenc .def files, so is allowed anywhere.

```

62 %\@onlypreamble\ProvideTextCommandDefault
```

They require \?-cmd to be initialized as \@changed@cmd.

63 \expandafter\let\csname?-cmd\endcsname\@changed@cmd

#### \DeclareTextAccent

This is just a disguise for defining a TFX \accent command.

```
64 \def\DeclareTextAccent#1#2#3{%
65 \DeclareTextCommand#1{#2}{\add@accent{#3}}}
66 \@onlypreamble\DeclareTextAccent
```

#### \add@accent

To save space this code is shared between all text accents that are set using the \accent primitive. The argument is pre-set in a box so that any font loading that is needed is already done within the box. This is needed because font-loading involves grouping and that would prevent the accent mechanism from working so that the accent would not be positioned over the argument. Declarations that change the font should be allowed (only low-level ones are at present) inside the argument of an accent command, but not size changes, as they involve \setbox operations which also inhibit the mechanism of the \accent primitive.

Note that the whole process is within a group. For a detailed discussion of this reimplementation and its deficiencies, see pr/3160.

67 \def\add@accent#1#2{\hmode@bgroup

File l: ltoutenc.dtx Date: 2017/04/05 Version v2.0i

Turn off the group in \UseTextSymbol in case this is used inside the argument of \add@accent.

- 68 \let\hmode@start@before@group\@firstofone
- 69 \setbox\@tempboxa\hbox{#2%

When presetting the argument in a box we record its \spacefactor for later use after the accent got typeset. This way something like \'A gets the spacefactor of A (i.e., 999) rather than the default value of 1000.

- 70 \global\mathchardef\accent@spacefactor\spacefactor}%
- 71 \accent#1 #2\egroup\spacefactor\accent@spacefactor}

Default definition for \accent@spacefactor prevents a horrible death of the above macro inside an unprotected \edef.

72 \let\accent@spacefactor\relax

\hmode@bgroup

73 \def\hmode@bgroup{\leavevmode\bgroup}

\DeclareTextCompositeCommand
\DeclareTextComposite
\QtextQcomposite
\QtextQcompositeQx
\QstripQargs

Another amusing game to play with \expandafter, \csname, and \string. When you say \DeclareTextCompositeCommand{\foo}{T1}{a}{bar}, we look to see if the expansion of \T1\foo begins with \@text@composite, and if it doesn't, we redefine \T1\foo to be:

```
#1 -> \@text@composite \T1\foo #1\@empty \@text@composite {...}
```

where ... is the previous definition of  $\T1\foo-a$  to expand to bar.

122 (*2ekernel)
123 \verb|\Conlypreamble| Declare Text Composite Command
```

This all works because:

```
\@text@composite \T1\foo A\@empty \@text@composite {...}
```

expands to  $\T1\foo-A$  if  $\T1\foo-A$  has been defined, and  $\{\ldots\}$  otherwise.

Note that \@text@composite grabs the first token of the argument and puts just that in the csname. This is so that \'{\textit{e}}} will work—it checks whether \\T1\'-\textit is defined (which presumably it isn't) and so expands to {\accent 1 \textit{e}}.

This trick won't always work, for example \'{{\itshape e}} will expand to (with spaces added for clarity):

```
\csname \string \T1\', - \string {\itshape e} \@empty \endcsname
```

which will die pretty horribly. Unfortunately there's not much can be done about this if we're going to use \csname lookups as a fast way of accessing composites.

This has an unfortunate 'misfeature' though, which is that in the T1 encoding, \'{aa} produces \(\alpha\). This is not the expected behaviour, and should perhaps be fixed if the fix doesn't affect performance too badly.

Finally, it's worth noting that the \@empty is used in \@text@composite so that accents will work even when the argument is empty. If you say \'{}} then this looks up \\T1\',-\@empty, which ought to be \relax, and so all is well. If we didn't include the \@empty, then \'{} would expand to:

```
\csname \string \T1\', - \string \endcsname
```

so the \endcsname would be \string'ed and the whole of the rest of the document would be put inside the \csname. This would not be good.

```
\def\@text@composite#1#2#3\@text@composite{%
125
      \expandafter\@text@composite@x
126
         \csname\string#1-\string#2\endcsname}
```

Originally the \@text@composite@x macro had two arguments and if #1 was not \relax it was executed, otherwise #2 was executed. All this happened within the \ifx code so that neither #1 nor #2 could have picked up any additional arguments form the input stream. This has now being changed using the typical \@firstoftwo / \@secondoftwo coding. This way the final expansion will happen without any \else or \fi intervening in the case that we need to get a further token from the input stream.

```
127 \def\@text@composite@x#1{%
128 \ifx#1\relax
129 \expandafter\@secondoftwo
130 \else
131 \expandafter\@firstoftwo
132 \fi
133 #1}
```

The command \DeclareTextComposite uses \DeclareTextCompositeCommand to declare a command which expands out to a single glyph.

```
134 \catcode\z@=11\relax

135 \def\DeclareTextComposite#1#2#3#4{%

136 \def\reserved@a{\DeclareTextCompositeCommand#1{#2}{#3}}%

137 \bgroup

138 \lccode\z@#4%

139 \lowercase{%

140 \egroup

141 \reserved@a ^^@}}

142 \catcode\z@=15\relax
```

\UseTextAccent \UseTextSymbol \@use@text@encoding These fragile commands access glyphs from different encodings. They use grotty low-level calls to the font selection scheme for speed, and in order to make sure that \UseTextSymbol doesn't do anything which you're not allowed to do between an \accent and its glyph.

For a detailed discussion of this reimplementation and its deficiencies, see  $\mathrm{pr}/3160.$ 

```
144 \def\UseTextAccent#1#2#3{%
145 \hmode@start@before@group
146 {%
```

143 \@onlypreamble\DeclareTextComposite

```
#2%
158
           }%
159
       }
160
161 \def\@use@text@encoding#1{%
      \edef\f@encoding{#1}%
162
      \xdef\font@name{%
163
          \csname\curr@fontshape/\f@size\endcsname}%
164
165
      \pickup@font
166
      \font@name
      \@@enc@update}
```

\hmode@start@before@group

The \hmode@start@before@group starts hmode and should be immediately followed by an explicit {...}. Its purpose is to ensure that hmode is started before this group is opened. Inside \add@accent and \UseTextAccent it is redefined to remove this group so that it doesn't conflict with the \accent primitive.

For a detailed discussion see pr/3160.

168 \let\hmode@start@before@group\leavevmode

\DeclareTextSymbolDefault \DeclareTextAccentDefault

Some syntactic sugar. Again, these should probably be optimized for speed.

169 \def\DeclareTextSymbolDefault#1#2{%

170 \DeclareTextCommandDefault#1{\UseTextSymbol{#2}#1}}

171 \def\DeclareTextAccentDefault#1#2{%

172 \DeclareTextCommandDefault#1{\UseTextAccent{#2}#1}}

174 \@onlypreamble\DeclareTextAccentDefault

\UndeclareTextCommand

This command safely removes an encoding specific declaration for a given encoding. It is helpful if one intends to use the default definition always and therefore wants to get rid of a declaration for some specific encoding.

```
175 \def\UndeclareTextCommand#1#2{%
```

If there is no declaration for the current encoding do nothing. (This makes a hash table entry but without eTFX we can't do anything about that).

```
176 \expandafter\ifx\csname#2\string#1\endcsname\relax
```

177 \else

Else: throw away that declaration.

```
{\tt 178} \qquad {\tt \global\expandafter\let\csname\#2\string\#1\endcsname}
```

179 \@undefined

But this is unfortunately not enough, we have to take a look at the top-level definition of the encoding specific command which for a command \foo would look similar to \T1-cmd \foo \T1\foo (three tokens).

Of course, instead of T1 one could see a different encoding name; which one depends the encoding for which  $\S$ o was declared last.

Now assume we have just removed the declaration for \foo in T1 and the top-level of \foo expands to the above. Then we better change that pretty fast otherwise we do get an "undefined csname error" when we try to typeset \foo within T1 instead of getting the default definition for \foo. And what is the best way to change that top-level definition? Well, the only "encoding" we know for sure will still be around is the default encoding denoted by ?.

Thus in case the last token of the top-level expansion is now undefined we change the declaration to look like \?-cmd \foo \?\foo which is done by the following (readable?) code:

188 \@onlypreamble\UndeclareTextCommand

#### 20.4.2 Hyphenation

\patterns \@@patterns \hyphenation \@@hyphenation We redefine \patterns and \hyphenation to allow the use of commands declared with \DeclareText\* to be used inside them.

204 %
       \afterassignment\egroup
205 %
       \@@hyphenation
206 %}
```

#### 20.4.3 Miscellania

\a The \a command is used to access the accent commands even when they have been redefined (for example by the tabbing environment). Its internal name is \Ctabacckludge.

The \string within the \csname guards against something like 'being active at the point of use.

### 20.4.4 Default encodings

We define the default encodings for most commands to be either OT1, OML or OMS. These defaults are in the kernel and therefore fonts with these encodings

must be available unless these defaults are redefined elsewhere. Recall that the standard kernel loads the encoding files for these encodings, and also that for the T1 encoding.

The naming conventions in the kernel are not what we would use if we were starting from scratch... Those defined by DEK (like \ae and \ss) or by the TEX Users Group Technical Working Group on multi-lingual typesetting (like \th and \ng) have short names. Those which were added to the kernel in 1993 and early 1994 are named after their Adobe glyph names (like \guillemotleft and \quotedblbase). Unfortunately, this naming scheme won't work for all glyphs, since some names (like \space) are already used, and some (like \endash) are very likely to be defined by users. So we're now using the naming scheme of \text followed by the Adobe name, (like \textendash and \textsterling). Except that some glyphs don't have Adobe names, so we're using the names used by fontinst for those (like \textcompwordmark). Sigh.

Some accents from OT1:

```
210 \DeclareTextAccentDefault{\"}{OT1}
211 \DeclareTextAccentDefault{\';}{OT1}
212 \DeclareTextAccentDefault{\.}{OT1}
213 \DeclareTextAccentDefault{\=}{0T1}

# 20.5 Definitions for the OT1 encoding

```
The definitions for the 'TEX text' (OT1) encoding.
   Declare the encoding.
359 (*OT1)
360 \DeclareFontEncoding{OT1}{}{}
Declare the accents.
361 \DeclareTextAccent{\"}{0T1}{127}
362 \DeclareTextAccent{\'\}{OT1}{19}
363 \DeclareTextAccent{\.}{OT1}{95}
364 \DeclareTextAccent{\=}{0T1}{22}
365 \DeclareTextAccent{\^}{OT1}{94}
366 \DeclareTextAccent{\'}{OT1}{18}
367 \DeclareTextAccent{\~}{OT1}{126}
368 \DeclareTextAccent{\H}{OT1}{125}
369 \DeclareTextAccent{\u}{OT1}{21}
370 \DeclareTextAccent{\v}{OT1}{20}
371 \DeclareTextAccent{\r}{OT1}{23}
```

Some accents have to be built by hand: Note that **\ooalign** and **\oolign** must be inside a group. In these definitions we no longer use the helper function **\sh@ft** from plain.tex since that now has two incompatible definitions.

```
372 \DeclareTextCommand{\b}{OT1}[1]
           {\hmode@bgroup\o@lign{\relax#1\crcr\hidewidth\ltx@sh@ft{-3ex}%
               \vbox to.2ex{\hbox{\char22}\vss}\hidewidth}\egroup}
374
375 \DeclareTextCommand{\c}{OT1}[1]
           \label{leavevmode} $$ {\displaystyle \accent24 \ \#1} \in \mathbb{1}^2 = 1ex\accent24 \ \#1\% $$
376
             \else{\ooalign{\unhbox\z@\crcr\hidewidth\char24\hidewidth}}\fi}
377
378 \DeclareTextCommand{\d}{OT1}[1]
           {\hmode@bgroup
379
             \o@lign{\relax#1\crcr\hidewidth\ltx@sh@ft{-1ex}.\hidewidth}\egroup}
380
      Declare the text symbols.
381 \DeclareTextSymbol{\AE}{OT1}{29}
382 \DeclareTextSymbol{\OE}{OT1}{30}
383 \DeclareTextSymbol{\0}{0T1}{31}
384 \DeclareTextSymbol{\ae}{OT1}{26}
385 \DeclareTextSymbol{\i}{0T1}{16}
386 \DeclareTextSymbol{\j}{OT1}{17}
387 \DeclareTextSymbol{\oe}{OT1}{27}
388 \DeclareTextSymbol{\o}{OT1}{28}
389 \DeclareTextSymbol{\ss}{OT1}{25}
390 \DeclareTextSymbol{\textemdash}{OT1}{124}
391 \DeclareTextSymbol{\textendash}{OT1}{123}
Using the ligatures helps with OT1 fonts that have \textcaltandown and
\textquestiondown in unusual positions.
392 %\DeclareTextSymbol{\textexclamdown}{OT1}{60}
393 %\DeclareTextSymbol{\textquestiondown}{OT1}{62}
394 \DeclareTextCommand{\textexclamdown}{OT1}{!'}
395 \DeclareTextCommand{\textquestiondown}{OT1}{?'}
396 %\DeclareTextSymbol{\texthyphenchar}{OT1}{'\-}
397 %\DeclareTextSymbol{\texthyphen}{OT1}{'\-}
398 \DeclareTextSymbol{\textquotedblleft}{OT1}{92}
399 \DeclareTextSymbol{\textquotedblright}{OT1}{'\"}
400 \DeclareTextSymbol{\textquoteleft}{OT1}{'\'}
401 \DeclareTextSymbol{\textquoteright}{OT1}{'\'}
Some symbols which are faked from others:
402 % \DeclareTextCommand{\aa}{OT1}
               {{\accent23a}}
403 %
404 \DeclareTextCommand{\L}{OT1}
           {\label{leavevmode} $$ {\label{leavevmode} L}\hb@xt@\wd\z@{\hss\@xxxii L}} $$
405
406 \DeclareTextCommand{\1}{OT1}
           {\hmode@bgroup\@xxxii l\egroup}
408 % \DeclareTextCommand{\AA}{OT1}
               {\leavevmode\setbox\z@\hbox{h}\dimen@\ht\z@\advance\dimen@-1ex%
409 %
410 %
                 \rlap{\raise.67\dimen@\hbox{\char23}}A}
In the OT1 encoding Å has a hand-crafted definition, so we have here the first
recorded explicit use of \DeclareTextCompositeCommand.
411 \DeclareTextCompositeCommand{\r}{OT1}{A}
           {\label{leavevmode} $$ {\displaystyle \label{leavevmode} $$ i} \dim 0 \ ht\z 0 \ advance\ \ \ $$ i} \ dimen 0 - 1 \ ex \% $$ is $$ in 
412
413
              \rlap{\raise.67\dimen@\hbox{\char23}}A}
The dutch language uses the letter 'ij'. It is available in T1 encoded fonts, but not
in the OT1 encoded fonts. Therefor we fake it for the OT1 encoding.
414 \DeclareTextCommand{\ij}{OT1}{%
```

```
\nobreak\hskip\z@skip i\kern-0.02em j\nobreak\hskip\z@skip}
416 \DeclareTextCommand{\IJ}{OT1}{%
     \nobreak\hskip\z@skip I\kern-0.02em J\nobreak\hskip\z@skip}
In the OT1 encoding, £ and \$ share a slot.
418 \DeclareTextCommand{\textdollar}{OT1}{\hmode@bgroup
      \ifdim \fontdimen\@ne\font >\z@
420
         \slshape
421
      \else
422
         \upshape
      \fi
423
      \char'\$\egroup}
424
425 \DeclareTextCommand{\textsterling}{OT1}{\hmode@bgroup
      \ifdim \fontdimen\@ne\font >\z@
426
427
         \itshape
428
      \else
429
         \fontshape{ui}\selectfont
      \fi
430
      \char'\$\egroup}
431
```

Here we are adding some more composite commands to the OT1 encoding. This makes the use of certain accents with i compatible with their use with the T1 encoding; this enables them to become true LATEX internal representations. However, it will make these accents work a little less fast since a check will always be made for the existence of a composite.

```
432 \DeclareTextComposite{\.}{0T1}{i}{'\i}
433 \DeclareTextComposite{\.}{0T1}{i}{'\i}
434 \DeclareTextCompositeCommand{\'}{0T1}{i}{\centsfarseteq\'\i}
435 \DeclareTextCompositeCommand{\'}{0T1}{i}{\centsfarseteq\'\i}
436 \DeclareTextCompositeCommand{\'^}{0T1}{i}{\^\i}
437 \DeclareTextCompositeCommand{\''}{0T1}{i}{\''\i}

T1 encoding is given more extensive set of overloads for \c But here we just adjust \c{g}.
438 \ifx\textcommaabove\@undefined\else
439 \DeclareTextCompositeCommand{\c}{0T1}{g}{\textcommaabove{g}}
```

# 20.6 Definitions for the T1 encoding

The definitions for the 'Extended TeX text' (T1) encoding. Declare the encoding.

```
442 (*T1)
443 \DeclareFontEncoding{T1}{}{}

Declare the accents.

444 \DeclareTextAccent{\'}{T1}{0}

#### Definitions for the OML encoding 20.8

The definitions for the 'T<sub>E</sub>X math italic' (OML) encoding. Even though this is meant to be a math font, it includes some of the standard LATEX text symbols.

Declare the encoding.

```
679 (*OML)
680 \DeclareFontEncoding{OML}{}{}
Declare the symbols.
681 \label{lem:continuous} $$0ML}{``<}
682 \DeclareTextSymbol{\textgreater}{OML}{'\>}
683 \DeclareTextAccent{\t}{OML}{127} % "7F
684 (/OML)
```

#### 20.9 Definitions for the OT4 encoding

These definitions are for the Polish extension to the 'TFX text' (OT1) encoding. This encoding was created by B. Jackowski and M. Ryćko for use with the Polish version of Computer Modern and Computer Concrete. In positions 0–127 it is identical to OT1 but it contains some additional characters in the upper half. The LATEX support was developed by Mariusz Olko.

The PL fonts that use it are available as follows:

```
Metafont sources ftp://ftp.gust.org.pl/TeX/language/polish/pl-mf.zip;
   Font files ftp://ftp.gust.org.pl/TeX/language/polish/pl-tfm.zip.
   Declare the encoding.
685 (*OT4)
686 \DeclareFontEncoding{OT4}{}{}
687 \DeclareFontSubstitution\{0T4\}\{cmr\}\{m\}\{n\}
Declare the accents.
688 \DeclareTextAccent{\"}{0T4}{127}

698 \DeclareTextAccent{\r}{0T4}{23}
```

114

definition for \k. Some other accents have to be built by hand as in OT1:

699 \DeclareTextCommand{\k}{0T4}[1]{%

700

\TextSymbolUnavailable{\k{#1}}#1}

The ogonek accent is available only under a e A & E. But we have to provide some

In these definitions we no longer use the helper function \sh@ft from plain.tex since that now has two incompatible definitions.

```
701 \DeclareTextCommand{\b}{0T4}[1]

### 20.11 Definitions for the TU encoding

The TU encoding was originally introduced in the contributed package fontspec as a Unicode encoding for XeTeX and LuaTeX.

Normally for these engines, the input consists of Unicode characters encoded in UTF-8. There is therefore little need to use the traditional (ASCII) encoding-specific commands

However, sometimes (e.g. for backwards compatibility) it can be useful to access these Unicode characters via such ASCII-based markup. The commands provided here Cover the characters in the T1 and TS1 encodings, but specified in Unicode position. Almost all the command names have been mechanically extracted form the inputenc UTF-8 support, which is essentially doing a reverse mapping from UTF-8 data to LATEX LICR commands.

A few additional names for character which were supported in the original fontspec version of this file have also been added, even though they are not currently in the default inputenc UTF-8 declarations.

```
908 (*TU)
```

In the base interface the Unicode encoding is always known as TU But we parameterise the encoding name to allow for modelling differences in Unicode support by different fonts.

909 \providecommand\UnicodeEncodingName{TU}

As the Unicode encoding, TU, is only currently available with XeTeX or LuaTeX, we detect these engines first, and make adjustments for the differing font loading syntax. For other engines, we issue a warning then abort this file, switching back to T1 encoding.

# 21 Package files

This file now also contains some packages that provide access to the more specialised encodings.

# 21.1 The fontenc package

This package allows authors to specify which encodings they will use. For each encoding F00, the package looks to see if the encoding F00 has already been declared. If it has not, the file focenc.def is loaded. The default encoding is set to be F00.

In addition the package at the moment contains extra code to extend the \@uclclist (list of upper/lower case pairs) for encodings that involve cyrillic characters. THIS IS A TEMPORARY SOLUTION and will not stay this way forever (or so we hope) but right now we are missing a proper interface for this and didn't wanted to rush it.

```
1378 (*package)
```

Here we define a macro that extends the **\@uclclist** if needed and afterwards turns itself in a noop.

```

1406
1407 \let\update@uclc@with@cyrillic\relax
1408 }
    Here we process each option:
1409 \DeclareOption*{%
       \let\encodingdefault\CurrentOption
1410
1411
       \edef\reserved@f{%
1412
         \lowercase{\def\noexpand\reserved@f{\CurrentOption enc.def}}}%
1413
       \reserved@f
1414
       \InputIfFileExists\reserved@f
1415
            {}{\PackageError{fontenc}%
             {Encoding file '\reserved@f' not found.%
1416
              \MessageBreak
1417
               You might have misspelt the name of the encoding}%
1418
             {Necessary code for this encoding was not
1419
              loaded.\MessageBreak
1420
              Thus calling the encoding later on will
1421
              produce further error messages.}}%
1422
      \let\reserved@f\relax
1423
```

In case the current encoding is one of a list of known cyrillic ones we extend the **\Qualclist**:

```
1424 \expandafter\in@\expandafter{\CurrentOption}%
1425 {T2A,T2B,T2C,X2,LCY,OT2}%
1426 \ifin@
```

But only if it hasn't already been extended. This might happen if there are several calls to fontenc loading one of the above encodings. If we don't do this check the \@uclclist gets unnecessarily big, slowing down the processing at runtime.

```
\expandafter\in@\expandafter\cyra\expandafter
1427
                                     {\@uclclist}%
1428
1429
          \ifin@
1430
          \else
            \update@uclc@with@cyrillic
1431
1432
         \fi
1433
      \fi
1434 }
1435 \ProcessOptions*
```

To save some space we get rid of the macro extending the \Quclclist (might have happened already).

#### 1437 \let\update@uclc@with@cyrillic\relax

1436 \fontencoding\encodingdefault\selectfont

Finally we pretend that the fontenc package wasn't read in. This allows for using it several times, e.g., in a class file and in the preamble (at the cost of not getting any version info). That kind of hackery shows that using a general purpose package just for loading an encoding is not the right kind of interface for setting up encodings — it will get replaced at some point in the future.

```
1438 \global\expandafter\let\csname ver@fontenc.sty\endcsname\relax 1439 \global\expandafter\let\csname opt@fontenc.sty\endcsname\relax 1440 \global\let\@ifl@ter@@\@ifl@ter 1441 \def\@ifl@ter#1#2#3#4#5{\global\let\@ifl@ter\@ifl@ter@@} 1442 \langlepackage\rangle
```

# 21.2 The textcomp package

This one is for the TS1 encoding which contains text symbols for use with the T1-encoded text fonts. It therefore first inputs the file TS1enc.def and then sets (or resets) the defaults for the symbols it contains. The result of this is that when one of these symbols is accessed and the current encoding does not provide it, the symbol will be supplied by a silent, local change to this encoding.

```
1443 (*TS1stv)
```

Since many PostScript fonts only implement a subset of TS1 many commands only produce black blobs of ink. To resolve the resulting problems a number of options have been introduced and some code has been developed to distinguish sub-encodings.

The sub-encodings have a numerical id and are defined as follows for TS1:

- #5 those TS1 symbols that are also in the ISO-Adobe character set; without textcurrency, which is often misused for the Euro. Older Type1 fonts from the non-TEX world provide only this subset.
- #4 = #5 + texteuro. Most newer fonts provide this.
- #3 = #4 + \textomega. Can also be described as TS1 $\cap$ (ISO-Adobe $\cup$ MacRoman). (Except for the missing "currency".)
- #2 = #3 + \textestimated + \textcurrency. Can also be described as TS1 ∩ Adobe-Western-2. This may be relevant for OpenType fonts, which usually show the Adobe-Western-2 character set.
- #1 = TS1 without \textcircled and \t. These two glyphs are often not implemented and if their kernel defaults are changed commands like \copyright unnecessarily fail.

```
\#0 = \text{full TS1}
```

And here a summary to go in the transcript file:

```
1444 \PackageInfo{textcomp}{Sub-encoding information:\MessageBreak
1445
        \space\space 5 = only ISO-Adobe without
1446
                                  \string\textcurrency\MessageBreak
        \space\space 4 = 5 + \string\texteuro\MessageBreak
1447
        \space\space 3 = 4 + \string\textohm\MessageBreak
1448
        \space\space 2 = 3 + \noexpand\textestimated+
1449
                                     \string\textcurrency\MessageBreak
1450
        \space\space 1 = TS1 - \noexpand\textcircled-
1451
1452
                                                 \string\t\MessageBreak
        \space\space 0 = TS1 (full)\MessageBreak
1453

```

File l: ltoutenc.dtx Date: 2017/04/05 Version v2.0i

\DeclareEncodingSubset

An encoding subset to which a font family belongs is declared by the command \DeclareEncodingSubset that takes the major encoding as the first argument (e.g., TS1), the family name as the second argument (e.g., cmr), and the subset encoding id as a third, (e.g., 0 for cmr).

The default encoding subset to use when nothing is known about the current font family is named?.

```
1458 \def\DeclareEncodingSubset#1#2#3{%

1459 \@ifundefined{#1:#2}%

1460 {\PackageInfo{textcomp}{Setting #2 sub-encoding to #1/#3}}%

1461 {\PackageInfo{textcomp}{Changing #2 sub-encoding to #1/#3}}%

1462 \@namedef{#1:#2}{#3}}

1463 \@onlypreamble\DeclareEncodingSubset
```

The options for the package are the following:

safe for unknown font families enables only symbols that are also in the ISO-Adobe character set; without "currency", which is often misused for the Euro. Older Type1 fonts from the non-TeX world provide only this subset.

**euro** enables the "safe" symbols plus the \texteuro command. Most newer fonts provide this.

full enables all TS1 commands; useful only with fonts like EC or CM bright.

almostfull same as "full", except that \textcircled and \t are not redefined from their defaults to avoid that commands like \copyright suddenly no longer work.

force ignore all subset encoding definitions stored in the package itself or in the configuration file and always use the default subset as specified by one of the other options (seldom useful, only dangerous).

\iftc@forced Switch used to implement the force option

```
1464 \newif\iftc@forced \tc@forcedfalse
```

This is implemented by defining the default subset:

The default is "almostfull" which means that old documents will work except that \textcircled and \t will use the kernel defaults (with the advantage that this also works if the current font (as often the case) doesn't implement these glyphs.

The "force" option simply sets the switch to true.

```
1469 \DeclareOption{force}{\tc@forcedtrue}
```

The suggestions to user is to use the "safe" option always unless that balks in which case they could switch to "almostfull" but then better check their output manually.

```
1470 \enskip 1470 \enskip 1471 \enskip 1471 \enskip 1471 \enskip 1472 \enskip 1472 \enskip 1472 \enskip 1472 \enskip 1473 \enskip 147
```

\CheckEncodingSubset

The command \CheckEncodingSubset will check if the current font family has the right encoding subset to typeset a certain command. It takes five arguments as follows: first argument is either \UseTextSymbol, \UseTextAccent depending on whether or not the symbol is a text symbol or a text accent.

The second argument is the encoding from which this symbol should be fetched. The third argument is either a fake accessor command or an error message. the code in that argument (if ever executed) receives two arguments: #2 and #5 of \CheckEncodingSubset.

Argument four is the subset encoding id to test against: if this value is higher than the subset id of the current font family then we typeset the symbol, i.e., execute #1{#2}#5 otherwise it runs #3#5, e.g., to produce an error message or fake the glyph somehow.

Argument five is the symbol or accent command that is being checked.

For usage examples see definitions below.

#### 1474 \iftc@forced

If the "force" option was given we always use the default for testing against.

```
1475 \def\CheckEncodingSubset#1#2#3#4#5{%
        \ifnum #4>%
1476
             0\csname #2:?\endcsname
1477
1478
             \relax
1479
       \expandafter\@firstoftwo
1480
1481
       \expandafter\@secondoftwo
1482
1483
      {#1{#2}}{#3}%
1484
      #5%
1485 }
```

In normal circumstances the test is a bit more complicated: first check if there exists a macro  $\langle arg2 \rangle : \langle current-family \rangle$  and if so use that value to test against, otherwise use the default to test against.

```
1486 \else
1487 \def\CheckEncodingSubset#1#2#3#4#5{%
         \ifnum #4>%
1488
           \expandafter\ifx\csname #2:\f@family\endcsname\relax
1489
             0\csname #2:?\endcsname
1490
1491
           \else
1492
             \csname #2:\f@family\endcsname
1493
           \fi
1494
       \relax
1495
       \expandafter\@firstoftwo
1496
      \else
       \expandafter\@secondoftwo
1497
1498
     \fi
      {#1{#2}}{#3}%
1499
1500
      #5%
1501 }
1502 \fi
```

#### tc@subst

```
1503 \def\tc@subst#1{%
1504 \tc@errorwarn{textcomp}% % should be latex error if general
```

```
1505 {Symbol \string#1 not provided by\MessageBreak
1506 font family \f@family\space
1507 in TS1 encoding.\MessageBreak Default family used instead}\@eha
1508 \bgroup\fontfamily\textcompsubstdefault\selectfont#1\egroup
1509 }
```

\textcompsubstdefault

1510 \def\textcompsubstdefault{cmr}

\tc@error

\tc@error is going to be used in arg #3 of \CheckEncodingSubset when a symbol is not available in a certain font family. It gets pass the encoding it normally lives in (arg one) and the name of the symbol or accent that has a problem.

\tc@fake@euro

\tc@fake@euro is an example of a "fake" definition to use in arg #3 of \CheckEncodingSubset when a symbol is not available in a certain font family. Here we produce an Euro symbol by combining a "C" with a "=".

```
1519 \def\tc@fake@euro#1{%
1520
       \leavevmode
       \PackageInfo{textcomp}{Faking \noexpand#1for font family
1521
                                \f@family\MessageBreak in TS1 encoding}%
1522
       \valign{##\cr
1523
          \vfil\hbox to 0.07em{\dimen@\f@size\p@
1524
                                 \math@fontsfalse
1525
                                 \fontsize{.7\dimen@}\z@\selectfont=\hss}%
1526
          \vfil\cr%
1527
1528
          \hbox{C}\crcr
1529
       }%
1530 }
```

\tc@check@symbol \tc@check@accent

These are two abbreviations that we use below to check symbols and accents in TS1. Only there to save some space, e.g., we can then write

\DeclareTextCommandDefault{\textcurrency}{\tc@check@symbol3\textcurrency}

to ensure that \textcurrency is only typeset if the current font has a TS1 subset id of less than 3. Otherwise \tc@error is called telling the user that for this font family \textcurreny is not available.

```
1531 \end{CheckEncodingSubset\UseTextSymbol{TS1}\tc@subset} \\ 1532 \end{CheckEncodingSubset\UseTextAccent{TS1}\tc@error}
```

We start with the commands that are "safe" and which can be unconditionally set up, first the accents.  $\dots$ 

```
1533 \DeclareTextAccentDefault{\capitalcedilla}{TS1}
1534 \DeclareTextAccentDefault{\capitalogonek}{TS1}
1535 \DeclareTextAccentDefault{\capitalgrave}{TS1}

        {\tc@check@symbol2\textsurd}
1715
```

The \textcircled and \t are handled specially, unless the current font has a subset id of 0 (i.e. full TS1) we pick the symbols up from the the math font encodings, i.e., the third argument to  $\CheckEncodingSubset$  uses  $\UseTextAccent$  to get them from there.

```
1716 \DeclareTextCommandDefault{\textcircled}
1717 {\CheckEncodingSubset\UseTextAccent{TS1}%
1718 {\UseTextAccent{OMS}}1\textcircled}
1719 \DeclareTextCommandDefault{\t}
1720 {\CheckEncodingSubset\UseTextAccent{TS1}%
1721 {\UseTextAccent{OML}}1\t}
```

Finally input the encoding-specific definitions for TS1 thus making the toplevel definitions optimised for this encoding (and not for the default encoding, see section 20.2).

```
1722 \input{ts1enc.def}
```

Now having the new glyphs available we also want to make sure that they are used. For most cases this will automatically happen but for some glyphs there are inferior definitions already known to LATEX which will prevent the usage of the TS1 versions (see section 20.1 above). So we better get rid of them:

```
1723 \UndeclareTextCommand{\textsterling}{0T1}
1724 \UndeclareTextCommand{\textdollar} {0T1}
```

Similar declarations should probably be made for other encodings like OT4 if they are in use.

```
1725 %\UndeclareTextCommand{\textsterling}{0T4}
1726 %\UndeclareTextCommand{\textdollar} {0T4}
```

From the T1 encoding there are two candidates for removal: ‰ and ‱ since these are both constructed from % followed by a tiny 'o' rather than being a single glyph. The problem with this approach is that in PostScript fonts this small zero is usually not available resulting in ‰ rather than ‰ while the real glyph (at least for \textperthousand) is available in the PostScript version of TS1. So for the moment we compromise by removing the T1 declaration for \textperthousand but keeping the one for \textpertenthousand. This will have the effect that with Computer Modern fonts everything will come out (although ‰ and ‱ are not taken from the same physical font) and with PostScript fonts ‰ will come out correctly while ‱ will most likely look like ‰ — which is probably an improvement over just getting a single '•' to indicate a completely missing glyph, which would happen if we also 'undeclared' \textpertenthousand.

```
1727 \UndeclareTextCommand{\textperthousand}{T1}
1728 \UndeclareTextCommand{\textpertenthousand}{T1}
```

### 21.2.1 Supporting oldstyle digits

```
1729 \DeclareRobustCommand\oldstylenums[1]{%
1730 \begingroup
      \ifmmode
1731
       \mathgroup\symletters #1%
1732
1733
       \CheckEncodingSubset\@use@text@encoding{TS1}%
1734
1735
           {\PackageWarning{textcomp}%
1736
               {Oldstyle digits unavailable for
1737
               family \f@family.\MessageBreak
1738
               Lining digits used instead}}%
1739
           \tw@{#1}%
       \fi
1740
1741
     \endgroup
1742 }
```

### 21.2.2 Subset encoding defaults

For many font families commonly used in the TEX world we provide the subset encoding data here. Users can add additional font families in the file textcomp.cfg if they own other fonts.

However, if the option "forced" was given then all subset encoding specifications are ignored, so there is no point in setting any of them up:

```
1743 \iftc@forced \else
```

Computer modern based fonts (e.g., CM, CM-Bright, Concrete):

```
1744 \DeclareEncodingSubset{TS1}{cmr} {0}
1745 \DeclareEncodingSubset{TS1}{cmss} {0}
1746 \DeclareEncodingSubset{TS1}{cmtt} {0}
1747 \DeclareEncodingSubset{TS1}{cmvtt} {0}
1748 \DeclareEncodingSubset{TS1}{cmbr} {0}
1749 \DeclareEncodingSubset{TS1}{cmtl} {0}
1750 \DeclareEncodingSubset{TS1}{ccr} {0}
```

File l: ltoutenc.dtx Date: 2017/04/05 Version v2.0i

```
PSNFSS fonts:
1751 \DeclareEncodingSubset{TS1}{ptm}
                                           {4}
1752 \DeclareEncodingSubset{TS1}{pcr}

```

If the file textcomp.cfg exists it will be loaded at this point. This allows to define further subset encodings for font families not covered by default.

### File m

# ltcounts.dtx

# 22 Counters and Lengths

Commands for defining and using counters. This file defines:

```
To define a new counter.
    \newcounter
                       To set the value of counters.
    \setcounter
  \addtocounter
                       Increase the counter #1 by the number #2.
                       Increase a counter by one.
   \stepcounter
\refstepcounter
                       Increase a counter by one, also setting the value used by \label.
          \value
                       For accessing the value of the counter as a TFX number (as opposed to
                    \ which expands to the printed representation of \langle counter \rangle
                       \arabic{\langle counter \rangle}: 1, 2, 3, \dots
         \arabic
                       \mbox{roman}{\langle counter \rangle}: i, ii, iii, ...
          \roman
                       \mathbb{C}  \Roman{\langle counter \rangle}: I, II, III, ...
          \Roman
           \alph
                       \Lambda \left( counter \right) : A, B, C, \dots
           \Alph
      \fnsymbol
                       \footnotemark: *, †, ‡, ...
                      _1 \langle *2ekernel \rangle
```

### 22.1 Environment Counter Macros

An environment foo has an associated counter defined by the following control sequences:

\c@foo Contains the counter's numerical value. It is defined by \newcount\foocounter.

\thefoo Macro that expands to the printed value of \foocounter.

For example, if sections are numbered within chapters, and

section headings look like

Section II-3. The Nature of Counters then \thesection might be defined by:

\def\thesection

{\@Roman{\c@chapter}-\@arabic{\c@section}}

\p@foo Macro that expands to a printed 'reference prefix' of counter foo. Any \ref to a value created by counter foo will produce the expansion of \p@foo\thefoo when the \label command is executed. See file ltxref.dtx for an extension of this mech-

anism.

\cl@foo List of counters to be reset when foo stepped. Has format \@elt{countera}\\delt{counterb}\\delt{counterc}.

### NOTE:

\thefoo and \p@foo must be defined in such a way that \edef\bar{\thefoo} or \edef\bar{\p@foo} defines \bar so that it will evaluate to the counter value at the time of the \edef, even after \foocounter and any other counters have been changed. This will happen if you use the standard commands \@arabic, \@Roman, etc.

The following commands are used to define and modify counters.

```
\rcsin {\langle foo \rangle}
```

Same as \stepcounter, but it also defines \@currentreference so that a subsequent  $\label{bar}$  command causes  $\rf{bar}$  to generate the current value of counter  $\langle foo \rangle$ .

 $\ensuremath{\texttt{Qdefinecounter}}$ 

Initializes counter  $\{\langle foo \rangle\}$  (with empty reset list), defines \p@foo and \thefoo to be null. Also adds \( \foo \) to \clockpt - the reset list of a dummy counter @ckpt used for taking checkpoints for the \include system.

 $\dot{Qaddtoreset}(\langle foo \rangle) \{\langle bar \rangle\} : Adds counter \langle foo \rangle to the list of counters$ \cl@bar to be reset when counter  $\langle bar \rangle$  is stepped.

 $\strut {\langle foo \rangle} {\langle val \rangle} : Globally sets \foocounter equal to \foocounter equal to \footonstand val \cdots.$ \setcounter

- 2 \def\setcounter#1#2{%
- \@ifundefined{c@#1}%
- {\@nocounterr{#1}}% 4
- {\global\csname c@#1\endcsname#2\relax}}

\addtocounter \addtocounter  $\{\langle foo \rangle\} \{\langle val \rangle\}$  Globally increments \foocounter by  $\langle val \rangle$ .

- 6 \def\addtocounter#1#2{%
- \@ifundefined{c@#1}%
- {\@nocounterr{#1}}% 8
- {\global\advance\csname c@#1\endcsname #2\relax}}

\newcounter $\{\langle newctr \rangle\}$  [ $\langle oldctr \rangle$ ] Defines  $\langle newctr \rangle$  to be a counter, which is reset when counter  $\langle oldctr \rangle$  is stepped. If  $\langle newctr \rangle$  already defined produces 'c@newctr already defined' error.

- 10 \def\newcounter#1{%
- \expandafter\@ifdefinable \csname c@#1\endcsname 11
- 12 {\@definecounter{#1}}%
- \@ifnextchar[{\@newctr{#1}}{}}

\value \value{ $\langle ctr \rangle$ } produces the value of counter  $\langle ctr \rangle$ , for use with a \setcounter or \addtocounter command.

14 \def\value#1{\csname c@#1\endcsname}

\@newctr

- 15 \def\@newctr#1[#2]{%
- 16  $\ensuremath{\mbox{\counterr}{\#2}}{\ensuremath{\mbox{\counterr}{\#2}}}}$

\stepcounter

\stepcounterfoo Globally increments counter \c@F00 and resets all subsidiary counters.

- 17 \def\stepcounter#1{%
- 18 \addtocounter{#1}\@ne
- 19 \begingroup
- \let\@elt\@stpelt 20
- \csname cl@#1\endcsname 21
- \endgroup}

Rather than resetting the "within" counter to zero we set it to -1 and then run \stepcounter that moves it to 0 and also initiates resetting the next level down.

\Offnsymbol Typesetting old fashioned footnote symbols. This can be done both in text or math mode now.

This macro is another example of an ever recurring problem in TeX: Determining if something is text-mode or math-mode. It is imperative for the decision between text and math to be delayed until the actual typesetting is done as the code in question may go through an \edef or \write where an \iffmode test would be executed prematurely. Hence in the implementation below, \@fnsymbol is not robust in itself but the parts doing the actual typesetting are.

In the case of  $\ensuremath{\texttt{Qfnsymbol}}$  we make use of the robust command  $\ensuremath{\texttt{TextOrMath}}$  which takes two arguments and typesets the first if in text-mode and the second if in math-mode. Note that in order for this command to make the correct decision, it must insert a  $\ensuremath{\texttt{Telax}}$  token if run under regular  $\ensuremath{\texttt{TeX}}$ , which ruins any kerning between the preceding characters and whatever awaits typesetting. If you use  $\ensuremath{\texttt{TeX}}$  as engine for  $\ensuremath{\texttt{LATeX}}$  (as recommended) this unfortunate side effect is not present.

```

91 (latexrelease)\EndIncludeInRelease
92 (*2ekernel)
```

\TextOrMath

When using regular TEX, we make this command robust so that it always selects the correct branch in an \ifmmode switch with the usual disadvantage of ruining kerning. For the application we use it for here that shouldn't matter. The alternative would be to mimic \IeC from inputenc but then it wil have the disadvantage of choosing the wrong branch if appearing at the beginning of an alignment cell. However, users of eTEX will be pleasantly surprised to get the best of both worlds and no bad side effects.

First some code for checking if we are running eTeX but making sure not to permanently turn \protected into \relax.

```
\begin{array}{l} 93 \ \langle /2 ekernel \rangle \\ 94 \ \langle latexrelease \rangle \\ 1nclude InRelease \{ 2015/01/01 \} \{ TextOrMath \} \\ 95 \ \langle *2 ekernel \mid latexrelease \rangle \\ 96 \ beging roup \\ expandafter \expandafter \expandafter \expandafter \\ 97 \ expandafter \ifx \expanda protected \ends name \end{ter} \\ \end{array}
```

In case of ordinary TEX we define **\TextOrMath** as a robust command but make sure it always grabs its arguments. If we didn't do this it might very well gobble spaces in the input stream.

```
98 \DeclareRobustCommand\TextOrMath{%
99 \ifmmode \expandafter\Gsecondoftwo
100 \else \expandafter\Gfirstoftwo \fi}
101 \protectedGedef\TextOrMath#1#2{\TextOrMath{#1}{#2}}
102 \else
```

For eTEX the situation is similar. The robust macro is a hidden one so that we again avoid problems of gobbling spaces in the input.

```
103 \protected\expandafter\def\csname TextOrMath\space\endcsname{% 104 \ifmmode \expandafter\@secondoftwo 105 \else \expandafter\@firstoftwo \fi} 106 \edef\TextOrMath#1#2{% 107 \expandafter\noexpand\csname TextOrMath\space\endcsname 108 {#1}{#2}} 109 \fi 110 \( /2\expandafter\end{alignment} \)
```

```
 111 \ \langle latexrelease \rangle EndIncludeInRelease \\ 112 \ \langle latexrelease \rangle IncludeInRelease \{0000/00/00\} \{TextOrMath\} \{TextOrMath\} \\ 113 \ \langle latexrelease \rangle let TextOrMath \ \langle latexrelease \rangle EndIncludeInRelease \\ 115 \ \langle *2ekernel \rangle \\ 116 \ \langle /2ekernel \rangle
```

```

### File o

# ltfssbas.dtx

This file contains the main implementation of the 'low level' font selection commands. See other parts of the LATEX distribution, or *The LATEX Companion* for higher level documentation of the LATEX 'New' Font Selection Scheme.

Warning: The macro documentation is still basically the documentation from the first NFSS release and therefore in some cases probably not completely accurate.

The '2ekernel' code ensures that a \usepackage{autofss1} is essentially ignored if a 'full' format is being used that has picture mode already in the format. Note the autofss2 loading is currently disabled.

 $1 \langle 2ekernel \rangle = \sqrt{2ekernel} = \sqrt{2ekernel}$ 

# 24 Preliminary macros

We define a number of macros that will be used later.

\@nomath

**\Onomath** is used by most macros that will have no effect in math mode. It issues a warning message.

```
2 (*2ekernel)
```

- 3 \def\@nomath#1{\relax\ifmmode
- 4 \@font@warning{Command \noexpand#linvalid in math mode}\fi}

\no@alphabet@error

The macro \no@alphabet@error is called whenever the user requests a math alphabet that is not available in the current version. In math mode an error message is produced otherwise the command keeps silent. The argument is the name of the control sequence that identifies the math alphabet. The \relax at the beginning is necessary to prevent TeX from scanning too far in certain situations.

```
5 \gdef\no@alphabet@error#1{\relax \ifmmode
      \@latex@error{Math\space alphabet\space identifier\space
            \noexpand#1is\space undefined\space in\space math\space
8
             version\space '\math@version'}%
9
          {Your\space requested\space math\space alphabet\space
10
           is\space undefined\space in\space the\space current\space
            math\space version.^^JCheck\space the\space spelling\space
11
            or\space use\space the\space \noexpand\SetMathAlphabet\space
12
            command.}
13
       \fi}
14
```

\new@mathgroup \mathgroup

We also give a new name to \newfam and \fam to avoid verbal confusion (see the introduction).<sup>2</sup>

- $15 \label{loc08} \label{loc08} If $$ 15 \label{loc08} $$ \athgroup\chardef\sixt00n} $$$
- 16 \let\mathgroup\fam
- 17 %\let\newfam\new@mathgroup
- 18 \@onlypreamble\new@mathgroup

<sup>&</sup>lt;sup>2</sup>For the same reason it seems advisable to \let\fam and \newfam equal to \relax, but this is commented out to retain compatibility to existing style files.

# 25 Macros for setting up the tables

\DeclareFontShape

The macro \DeclareFontShape takes 6 arguments:

19 \def\DeclareFontShape{\begingroup

First we restore the catcodes of all characters used in the syntax.

20 \nfss@catcodes

We use \expandafter \endgroup to restore catcode in case something goes wrong with the argument parsing (suggested by Tim Van Zandt)

\DeclareFontShape

```
21
     \expandafter\endgroup
22
     \DeclareFontShape@}
23 \def\DeclareFontShape@#1#2#3#4#5#6{%
     \expandafter\ifx\csname #1+#2\endcsname\relax
24
       \@latex@error{Font family '#1+#2' unknown}\@eha
25
26
       \expandafter
27
          \xdef\csname#1/#2/#3/#4\endcsname{\expandafter\noexpand}
28
                                        \csname #5\endcsname}%
29
       \def\reserved@a{#6}%
30
31
       \global
        \expandafter\let\csname#5\expandafter\endcsname
32
33
           \ifx\reserved@a\@empty
34
             \@empty
35
           \else
             \reserved@a
36
           \fi
37
38
     \fi
    }
39
```

\DeclareFixedFont

Define a direct font switch that avoids all overhead.

```
40 \def\DeclareFixedFont#1#2#3#4#5#6{%
     \begingroup
41
        \math@fontsfalse
42
        \every@math@size{}%
43
        \fontsize{#6}\z@
44
        \usefont{#2}{#3}{#4}{#5}%
45
         \global\expandafter\let\expandafter#1\the\font
46
47
     \endgroup
48
```

\do@subst@correction

```
49 \def\do@subst@correction{%
50 \xdef\subst@correction{%
51 \font@name
52 \global\expandafter\font
53 \csname \curr@fontshape/\f@size\endcsname
54 \noexpand\fontname\font
55 \relax}%
```

Calling \subst@correction after the current group means calling it after we have loaded the substitution font which is done inside a group.

```
56 \aftergroup\subst@correction
57 }
```

#### \DeclareFontFamily

#### 58 \def\DeclareFontFamily#1#2#3{%

If we want fast checking for the encoding scheme we can just check for  $\T0.$  being defined.

```
59 % \@tempswafalse
60 % \def\reserved@b{#1}%
61 % \def\cdp@elt##1##2##3##4{\def\reserved@c{##1}%
62 % \ifx\reserved@b\reserved@c \@tempswatrue\fi}%
63 % \cdp@list
64 % \if@tempswa
65 \@ifundefined{T@#1}%
66 {%
67 \@latex@error{Encoding scheme '#1' unknown}\@eha
68 }%
69 {%
```

Now we have to define the macro  $\/ \#1 + (\#2)$  to contain #3. But since most of the time #3 will be empty we use \let in a tricky way rather than a simple \def since this will save internal memory. We store the argument #3 in a temporary macro \reserved@a.

#### 70 \def\reserved@a{#3}%

We compare \reserved@a with \@empty If these two are the same we \let the 'extra' macro equal to \@empty which is not the same a doing a \let to \reserved@a— the latter would blow one extra memory location rather then reusing the one from \@empty.

```
71 \qlobal
72 \expandafter\let\csname #1+#2\expandafter\endcsname
73 \ifx \reserved@a\@empty
74 \quad \quad
```

\cdp@list We initialize the code page list to be empty.

```
79 \let\cdp@list\@empty
80 \@onlypreamble\cdp@list
```

\cdp@elt

```
81 \let\cdp@elt\relax
82 \@onlypreamble\cdp@elt
```

#### \DeclareFontEncoding

#### 83 \def\DeclareFontEncoding{%

First we start with ignoring all blanks and newlines since every surplus space in the second or third argument will come out in a weird place in the document.

```
84 \begingroup
85 \nfss@catcodes
86 \expandafter\endgroup
87 \DeclareFontEncoding@}
88 \@onlypreamble\DeclareFontEncoding
```

To support encoding dependent commands (like accents) we initialise the command \( \langle encoding \rangle \)-cmd to be \\\ \Qchanged\( \

```
\expandafter\let\csname#1-cmd\endcsname\@changed@cmd
 96
 97
     \else
         \OfontOinfo{Redeclaring font encoding #1}%
 98
 99
     \fi
     \global\ensuremath{\mbox{Cnamedef}{T0\#1}{\#2}}\%
100
     \global\@namedef{M@#1}{\default@M#3}%
101
Keep a record of the last encoding being declared:
     \xdef\LastDeclaredEncoding{#1}%
102
104 \@onlypreamble\DeclareFontEncoding@
```

\LastDeclaredEncoding

The last encoding being declared by \DeclareFontEncoding.

105 \def\LastDeclaredEncoding{}

\DeclareFontSubstitution

```
106 \def\DeclareFontSubstitution#1#2#3#4{%
107 \expandafter
108 \ifx\csname TO#1\endcsname\relax
109 \Clatex@error{Encoding scheme '#1' unknown}\Geha
110 \else
111 \begingroup
```

We loop through the \cdp@list and rebuild it anew in \toks@ thereby replacing the defaults for the encoding in question with the new defaults. It is important to store the encoding to test against expanded in \reserved@a since it might just be \LastDeclaredEncoding that is passed as #1.

```
112 \edef\reserved@a{#1}%
113 \toks@{}%
114 \def\cdp@elt##1#2##3##4{%
115 \def\reserved@b{##1}%
116 \ifx\reserved@a\reserved@b
```

Here we use the new defaults but we use ##1 (i.e., the encoding name already stored previously) since we know that it is expanded.

```
117 \addto@hook\toks@{\cdp@elt{##1}{#2}{#3}{#4}}% 118 \else
```

If \reserved@a and \reserved@b differ then we simply copy from the old list to the new.

```
119 \addto@hook\toks@{\cdp@elt{##1}{##2}{##3}{##4}}%

120 \fi}%

121 \cdp@list
```

```
122
            \xdef\cdp@list{\the\toks@}%
123
        \endgroup
124
        \global
        \ensuremath{\mbox{Qnamedef}D0\#1}{\%}
125
               \def\default@family{#2}%
126
               \def\default@series{#3}%
127
               \def\default@shape{#4}%
128
129
               }%
130
     \fi
131 }

          \@font@info{Overwriting encoding scheme text defaults}%
136
137
        \gdef\default@T{#1}%
138
139
      \fi
140
      \ifx\relax#2\else
141
        \ifx\default@M\@empty\else
          \@font@info{Overwriting encoding scheme math defaults}%
142
143
        \gdef\default@M{#2}%
144
     \fi
145
146 }
147 \@onlypreamble\DeclareFontEncodingDefaults
148 \let\default@T\@empty
149 \let\default@M\@empty
150 \def\DeclarePreloadSizes#1#2#3#4#5{%
    \@ifundefined{T@#1}%
       {\@latex@error{Encoding scheme '#1' unknown}\@eha}%
152
```

\DeclarePreloadSizes

\default@T \default@M

\DeclareFontEncodingDefaults

```
153
```

Don't know at the moment what this group here does!

\begingroup

We define a macro \reserved@f<sup>3</sup> that grabs the next size and loads the corresponding font. This is done by delimiting \reserved@f's only argument by the token, (comma).

```
\def\reserved@f##1,{%
```

The end of the list will be detected when there are no more elements, i.e. when \reserved@f's argument is empty. The trick used here is explained in Appendix D of the TrXbook: if the argument is empty the \if will select the first clause and \let \reserved@f equal to \relax. (We use the > character here since it cannot appear in font file names.)

```
156
             \if>##1>%
```

```
157
              \let\reserved@f\relax
            \else
158
```

Otherwise, we define \font@name appropriately and call \pickup@font to do the work. Note that the requested \curr@fontshape combination must have been defined, or you will get an error. The definition of \font@name is carried out globally to be consistent with the rest of the code in this file.

```
159
160
    \pickup@font
```

Now we forget the name of the font just loaded. More precisely, we set the corresponding control sequence to \relax. This means that later on, when the font is first used, the macro \define@newfont is called again to execute the 'extra' macro for this font.

```
161
              \global\expandafter\let\font@name\relax
            \fi
162
```

Finally we call \reserved@f again to process the next size. If \reserved@f was \let equal to \relax this will end the macro.

```
\reserved@f}%
```

We finish with reinserting the list of sizes after the \reserved@f macro and appending an empty element so that the end of the list is recognized properly.

```
\reserved@f#5,,%
165
      \endgroup
166
      }%
167 }
168 \@onlypreamble\DeclarePreloadSizes
```

\ifmath@fonts

We need a switch to decide if we have to switch math fonts. For this purpose we provide \ifmath@fonts that can be set to true or false by the \SQ... macros depending on if math fonts are provided for this size or not. The default is of course to switch all fonts.

169 \newif\ifmath@fonts \math@fontstrue

\DeclareMathSizes \DeclareMathSizes\*

\DeclareMathSizes takes the text size, math text size, math script size, and math scriptscript size as arguments and defines the right \S0... macro.

```
170 \def\DeclareMathSizes{%
   \@ifstar{\@DeclareMathSizes\math@fontsfalse}%
172
         {\@DeclareMathSizes{}}}
```

\@DeclareMathSizes

This modification by Michael J. Downes on comp.text.tex on 2002/10/17 allows the user to have settings such as

 $\DeclareMathSizes{9.5dd}{9.5dd}{7.4dd}{6.6dd}.$

# 26 Selecting a new font

### 26.1 Macros for the user

\fontencoding \f@encoding

As we said in the introduction a font is described by four parameters. We first define macros to specify the wanted *family*, *series*, or *shape*. These are simply recorded in internal macros \f@family, \f@series, and \f@shape, resp. We use \edef's so that the arguments can also be macros.

```
216 \DeclareRobustCommand\fontencoding[1]{%
217 \expandafter\ifx\csname T@#1\endcsname\relax
218 \Qlatex@error{Encoding scheme '#1' unknown}\@eha
219 \else
220 \edef\f@encoding{#1}%
221 \ifx\cf@encoding\f@encoding
```

If the new encoding is the same as the old encoding we have nothing to do. However, in case we had a sequence of several encoding changes without a \selectfont in-between we can save processing by making sure that \enc@update is \relax.

```
222 \let\enc@update\relax
223 \else
```

If current and new encoding differ we define the macro \enc@update to contain all updates necessary at \selectfont time.

```
224 \let\enc@update\@@enc@update
225 \fi
226 \fi
227 }
```

#### \@@enc@update

228 \def\@@enc@update{%

When \@@enc@update is executed \f@encoding holds the encoding name for the new encoding and \cf@encoding the name of the last active encoding.

We start by setting the init command for encoding dependent macros to \@changed@cmd.

```
229 \expandafter
230 \let
231 \csname\cf@encoding -cmd\endcsname
232 \@changed@cmd
```

Then we turn the one for the new encoding to \@current@cmd (see ltoutenc.dtx for further explanations).

```
233 \expandafter
234 \let
235 \csname\f@encoding-cmd\endcsname
236 \@current@cmd
```

We execute the default settings \default@T, followed by the one for the new encoding.

```
237 \default@T
238 \csname T@\f@encoding\endcsname
```

Finally we change the default substitution values, disable \enc@update and make \f@encoding officially the current encoding.

```
239 \csname D@\f@encoding\endcsname
240 \let\enc@update\relax
241 \let\cf@encoding\f@encoding
242 }
```

\enc@update

The default action in \selectfont is to do nothing.

243 \let\enc@update\relax

```
\fontfamily
 \f@family
           244 \DeclareRobustCommand\fontfamily[1] {\edef\f0family}#1}}
\fontseries
           245 \DeclareRobustCommand\fontseries[1]{\edef\f@series{#1}}
 \f@series
           \fontshape
           Some handy abbreviation if you want to get some particular font in the current
  \f@shape
           size. If also the size should change one has to issue a \fontsize command first.
           247 \def\usefont#1#2#3#4{\fontencoding{#1}\fontfamily{#2}%
                           \fontseries{#3}\fontshape{#4}\selectfont
           248
                           \ignorespaces}
           249
```

\linespread The command \linespread changes the current \baselinestretch by calling \set@fontsize. The values for \f@size and \f@baselineskip will be left unchanged.

250 \DeclareRobustCommand\linespread[1]

251 {\set@fontsize{#1}\f@size\f@baselineskip}

\fontsize

We also define a macro that allows to specify a size. In this case, however, we also need the value of \baselineskip. As the first argument to \set@fontsize we pass the current value of \baselinestretch. This will either match the internal value (in which case nothing changes, or it will be an updated value due to a user change of that macro using \renewcommand. If we would pass the internal \f@linespread such a change would be effectively overwritten by a size change.

```
252 \DeclareRobustCommand\fontsize[2]
```

253 {\set@fontsize\baselinestretch{#1}{#2}}

\f@linespread This macro holds the current internal value for \baselinestretch.

```
254 \left( \frac{9}{254} \right)
```

255 \let\f@series\@empty

256 \let\f@shape\@empty

 $257 \left| \text{det} \right|$ 

259 \let\f@linespread\@empty

\cf@encoding

260 \let\f@encoding\@empty

261 \let\cf@encoding\@empty

\@defaultunits

The function **\@defaultunits** when wrapped around a dimen or skip assignment supplies default units. Usage:

\@defaultunits\dimen@=#1pt\relax\@nnil

Note: the \relax is \*important\*. Other units can be substituted for the 'pt' if desired.

We use **\removeQtoQnnil** as an auxiliary macros for **\Qdefaultunits**. It just has to gobble the supplied default unit 'pt' or whatever, if it wasn't used in the assignment.

 $262 \ensuremath{\verb| defaultunits{\afterassignment\remove@to@nnil|}}$ 

\strip@pt This macro strips the characters pt produced by using \the on a dimen register.

\rem@pt

263 \begingroup

264 \catcode'P=12

265 \catcode'T=12

266 \lowercase{

 $\label{lem:condition} $$ \def\x{\displaystyle \frac{m@pt\#1.\#2PT{\#1\leq mum\#2>\z@.\#2\leq i}}} $$$ 

268 \expandafter\endgroup\x

269 \def\strip@pt{\expandafter\rem@pt\the}

\mathversion \math@version

\mathversion takes the math *version* name as argument, defines \mathversion appropriately and switches to the font selected forcing a call to \glb@settings if the *version* is known to the system.

```
270 \DeclareRobustCommand\mathversion[1]
```

271 {\@nomath\mathversion

```
272 \expandafter\ifx\csname mv@#1\endcsname\relax
273 \@latex@error{Math version '#1' is not defined}\@eha\else
274 \edef\math@version{#1}%
```

We need to force a math font setup both now and at the point where we return to the previous math version. Forcing a math font setup can simply be done by setting \glb@currsize to an invalid value since this will trigger the setup when the formula starts.

```
275 \gdef\glb@currsize{}%
```

When the scope of the current \mathversion ends we need to restore the old setup. However this time we need to force it directly at least if we are inside math, otherwise we could wait. Another way to enhance this code here is todo the setting only if the version really has changed after all. This might be interesting in case of amstext and boldsymbol.

```
276 \aftergroup\glb@settings
277 \fi}
```

If TEX would support a hook just before the end of a formula (opposite of \everymath so to speak) the implementation of the algorithm would be much simpler because in that case we would set up the correct math fonts at this point without having to worry about incorrect settings due to nesting. The same would be true if in IATEX the use of \$ (as the primitive TEX command) would be impossible and instead only a higher-level interface would be available. Note that this does not mean that a \$ couldn't be the short-hand for starting and stopping that higher-level interface, it only means that the direct TEX function must be hidden.

Anyway, since we don't have this and won't have it in LATEX  $2\varepsilon$  we need to implement it in a somewhat slower way.

We test for the current math font setup on entry of a formula, i.e., on the hooks \everymath and \everydisplay. But since these hooks may contain user data we provide ourselves with an internal version of these hooks which stays frozen.

```
\frozen@everymath \frozen@everydisplay
```

\everymath

New internal names for \everymath and \everydisplay.

```
278 \let\frozen@everymath\everymath
279 \let\frozen@everydisplay\everydisplay
```

Now we provide now user hooks that will be called in the frozen internals.

\everydisplay 280 \newtoks\everymath 281 \newtoks\everydisplay

\frozen@everymath Now we define the behaviour of the frozen hooks: first check the math setup then call the user hook.

```
282 \frozen@everymath = {\check@mathfonts 283 \the\everymath}
```

\frozen@everydisplay Ditto for the display hook.

```
284 \frozen@everydisplay = {\check@mathfonts 285 \the\everydisplay}
```

\curr@math@size This holds locally the current math size.

286 \let\curr@math@size\@empty

# 26.2 Macros for loading fonts

\pickup@font

The macro \pickup@font which is used in \selectfont is very simple: if the font name is undefined (i.e. not known yet) it calls \define@newfont to load it.

```
287 \def\pickup@font{%
288 \expandafter \ifx \font@name \relax
289 \define@newfont
290 \fi}
```

\split@name

\pickup@font assumes that \font@name is set but it is sometimes called when \f@family, \f@series, \f@shape, or \f@size may have the wrong settings (see, e.g., the definition of \getanddefine@fonts). Therefore we need a macro to extract font family, series, shape, and size from the font name. To this end we define \split@name which takes the font name as a list of characters of \catcode 12 (without the backslash at the beginning) delimited by the special control sequence \@nil. This is not very complicated: we first ensure that / has the right \catcode

```
291 {\code'}/=12
```

and define \split@name so that it will define our private \f@encoding, \f@family, \f@series, \f@shape, and \f@size macros.

```
292 \gdef\split@name#1/#2/#3/#4/#5\@nil{\def\f@encoding{#1}%

293 \def\f@family{#2}%

294 \def\f@series{#3}%

295 \def\f@shape{#4}%

296 \def\f@size{#5}}}
```

\curr@fontshape

Abbreviation which may get removed again for speed.

297 \def\curr@fontshape{\f@encoding/\f@family/\f@series/\f@shape}

\define@newfont

Now we can tackle the problem of defining a new font.

```
298 \def\define@newfont{%
```

We have already mentioned that the token list that  $\split@name$  will get as argument must not start with a backslash. To reach this goal we will set the  $\split@name$  to -1 so that the  $\split@name$  primitive will not generate an escape character. To keep this change local we open a group. We use  $\split@name$  for this purpose since  $\split@name$  might be called in math mode, and an empty  $\split@name$  would add an empty Ord atom to the math list and thus affect the spacing.

Also locally redefine \typeout so that 'No file ...fd' Warnings become Font Info message just sent to the log file.

```
299 \begingroup
300 \let\typeout\@font@info
301 \escapechar\m@ne
```

Then we extract *encoding scheme*, *family*, *series*, *shape*, and *size* from the font name. Note the four \expandafter's so that \font@name is expanded first, then \string, and finally \split@name.

```
302 \expandafter\expandafter\expandafter
303 \split@name\expandafter\string\font@name\@nil
```

If the \curr@fontshape combination is not available, (i.e. undefined) we call the macro \wrong@fontshape to take care of this case. Otherwise \extract@font will load the external font for us.

```
304 % \expandafter\ifx
305 % \csname\curr@fontshape\endcsname \relax
306 \try@load@fontshape % try always
307 % \fi
308 \expandafter\ifx
309 \csname\curr@fontshape\endcsname \relax
310 \wrong@fontshape\else
```

To allow substitution we call the curr@fontshape macro which usually will expand to \relax but may hold code for substitution (see \subst@fontshape definition).

```
311 % \csname\curr@fontshape\endcsname
312 \extract@font\fi
```

We are nearly finished and must only restore the **\escapechar** by closing the group.

```
313 \endgroup}
314 \def\try@load@fontshape{%
315 \expandafter
316 \ifx\csname \f@encoding+\f@family\endcsname\relax
317 \@font@info{Try loading font information for
318 \f@encoding+\f@family}%
```

We predefine this combination to be **\Qempty** which means that next time we don't try again unnecessary in case we don't find a .fd file. If the file contains a **\DeclareFontFamily** command than this setting will be overwritten.

```
319 \global\expandafter\let
320 \csname\f@encoding+\f@family\endcsname\@empty
```

Set the catcodes used in the syntax, but do it only once (this will be restored at the end of the font loading group).

```
321 \nfss@catcodes
322 \let\nfss@catcodes\relax
```

For increased portability make the external filename monocase, but look for the (old style) mixed case filename if the first attempt fails.

On any monocase system this means that the file is looked for twice which takes up time and string space, but at least for this release Check for both names to give people time to re-install their private fd files with lowercase names.

```
323 \edef\reserved@a{%
324 \lowercase{%
325 \noexpand\InputIfFileExists{\f@encoding\f@family.fd}}}%
326 \reserved@a\relax
327 {\@input@{\f@encoding\f@family.fd}}%
328 \fi}
```

\nfss@catcodes

This macro should contain the standard \catcode assignments to all characters which are used in the commands found in an .fd file and which might have special \catcodes in the middle of a document. If necessary, this list can be extended in a package file using a suitable number of \expandafter, i.e.,

```
\expandafter\def\expandafter\nfss@catcodes
    \expandafter{\nfss@catcodes <additional settings>}
```

Note, that this macro might get executed several times since it is also called by \DeclareFontShape, thus it probably should not be misused as a general purpose hook.

#### 329 \def\nfss@catcodes{%

We start by making **Q** a letter and ignoring all blanks and newlines.

```
330 \makeatletter

331 \catcode'\ 9%

332 \catcode'\^19%

333 \catcode'\^^M9%
```

Then we set up  $\setminus$ ,  $\{$ ,  $\}$ , # and % in case an .fd file is loaded during a verbatim environment.

```
334 \catcode'\\z@

335 \catcode'\{\@ne

336 \catcode'\}\tw@

337 \catcode'\#6%

338 \catcode'\^7%

339 \catcode'\%14%
```

The we make sure that the important syntax parts have the right \catcode.

```
340
       \@makeother\<%
341
       \@makeother\>%
342
       \@makeother\*%
343
       \@makeother\.%
       \ensuremath{\tt @makeother}\-\%
344
       \@makeother\/%
345
       \@makeother\[%
346
347
       \@makeother\]%
       \@makeother\'%
348
       \@makeother\'%
349
       \@makeother\"%
350
351 }
```

#### \DeclareErrorFont

Declare the last resort shape! We assume that in this fontshape there is a 10pt font but it doesn't really matter. We only loose one macro name if the assumption is false. But at least the font should be there!

```
352 \def\DeclareErrorFont#1#2#3#4#5{%
353 \xdef\error@fontshape{%
354 \noexpand\expandafter\noexpand\split@name\noexpand\string
355 \expandafter\noexpand\csname#1/#2/#3/#4/#5\endcsname
356 \noexpand\@nil}%
```

Initialize all those internal variables which may or may not have values in the first seconds of NFSS' bootstraping process. Later on such values will be updated when an encoding is selected, etc.

We definitely don't want to set \f@encoding; we can set all the others since if they are left "blank" any selection would grap "error default values" as well. However, this probably should go also.

```
357 % \gdef\f@encoding{#1}%
358 \gdef\default@family{#2}%
359 \gdef\default@series{#3}%
360 \gdef\default@shape{#4}%
361 \global\let\f@family\default@family
```

```
362 \global\let\f@series\default@series
363 \global\let\f@shape\default@shape
364 \gdef\f@size{#5}%
365 \gdef\f@baselineskip{#5pt}%
366 }
367 \@onlypreamble\DeclareErrorFont
```

\wrong@fontshape

Before we come to the macro \extract@font we have to take care of unknown \curr@fontshape combinations. The general strategy is to issue a warning and to try a default *shape*, then a default *series*, and finally a default *family*. If this last one also fails TeX will go into an infinite loop. But if the defaults are set incorrectly one deserves nothing else!

```
368 </2ekernel>
369 <a href="mailto:latexrelease">latexrelease</a> \IncludeInRelease{2015/01/01}{\wrong@fontshape}%
370 <a href="mailto:latexrelease">latexrelease</a> <a href="mailto:font-substituation">fontshape}%
371 <a href="mailto:">*2ekernel</a> | latexrelease>
372 \def\wrong@fontshape{%
373 \csname D@\f@encoding\endcsname % install defaults if in math
```

We remember the wanted \curr@fontshape combination which we will need in a moment.

```
374 \edef\reserved@a{\csname\curr@fontshape\endcsname}%
375 \ifx\last@fontshape\reserved@a
376 \errmessage{Corrupted NFSS tables}%
377 \error@fontshape
378 \else
```

Then we warn the user about the mess and set the shape to its default.

```
379 \let\f@shape\default@shape
```

If the combination is not known, try the default series.

```
380 \expandafter\ifx\csname\curr@fontshape\endcsname\relax
381 \let\f@series\default@series
```

If this is still undefined, try the default *family*. Otherwise give up. We never try to change the encoding scheme!

```
382 \expandafter
383 \ifx\csname\curr@fontshape\endcsname\relax
384 \let\f@family\default@family
```

If we change the font family and we are in the preamble then the corresponding .fd file may not been loaded yet. Therefore we try this now. Otherwise equating the requested font shape with the finally selected fontshape below will fail and can result in "NFSS tables corruped". After begin document that will not happen as all .fd files involved in substituation are loaded at \begin{document}.

```
385 \begingroup
386 \try@load@fontshape
387 \endgroup
388 \fi \fi
389 \fi
```

At this point a valid \curr@fontshape combination must have been found. We inform the user about this fact.

The \expandafter\string here stops TEX adding the space that it usually puts after command names in messages. The similar construction with \Cundefined just produces 'undefined', but saves a few tokens.

\@wrong@font@char is locally redefined in \UseTextSymbol from its normal (empty) definition, to report the symbol generating the font switch.

We change \@defaultsubs to produce a warning at the end of the document. The macro \@defaultsubs is initially \relax but gets changed here if some default font substitution happens. It is then executed in \enddocument.

```
394 \gdef\@defaultsubs{%
395 \@font@warning{Some font shapes were not available, defaults
396 substituted.\@gobbletwo}}%
```

If we substitute a \curr@fontshape combination by the default one we don't want the warning to be printed out whenever this (unknown) combination is used. Therefore we globally \let the macro corresponding to the wanted combination equal to its substitution. This requires the use of four \expandafter's since \csname...\endcsname has to be expanded before \reserved@a (i.e. the requested combination), and this must happen before the \let is executed.

```
397 \global\expandafter\expandafter\eta
398 \expandafter\reserved@a
399 \csname\curr@fontshape\endcsname
```

Now we can redefine \font@name accordingly. This must be done globally since it might occur in the group opened by \define@newfont. If we would this definition were local the closing \endgroup there would restore the old meaning of \font@name and then switch to the wrong font at the end of \selectfont although the correct font was loaded.

```
400 \xdef\font@name{%
401 \csname\curr@fontshape/\f@size\endcsname}%
```

The last thing this macro does is to call \pickup@font again to load the font if it is not defined yet. At this point this code will loop endlessly if the defaults are not well defined.

```
\pickup@font}

\@wrong@font@char

Normally empty but redefined in \UseTextSymbol so that the Font shape undefined message can refer to the symbol causing the problem.

439 \let\@wrong@font@char\@empty

\@@defaultsubs

See above.

\@defaultsubs

440 \let\@defaultsubs\relax

\strip@prefix In \extract@font we will need a way to recover the replacement text of a macro. This is done by the primitive \meaning together with the macro \strip@prefix (for the details see appendix D of the T<sub>E</sub>Xbook, p. 382).

441 \def\strip@prefix#1>{}

#### Assigning math fonts to versions 27

\install@mathalphabet

This is just another name for \gdef but we can redefine it if necessary later on. 442 \let\install@mathalphabet\gdef

\math@fonts

443 \let\math@fonts\@empty

\select@group

\select@group has four arguments: the new \( math alphabet identifier \) (a control sequence), the  $\langle math\ group\ number \rangle$ , the extra macro for math mode and the \curr@fontshape definition macro name. We first check if we are in math mode.

444 %\def\select@group#1#2#3{\relax\ifmmode

We do these things locally using \begingroup instead of \bgroup to avoid the appearance of an empty Ord atom on the math list.

445 % \begingroup

We set the math fonts for the family in question by calling \getanddefine@fonts in the correct environment.

446 % \escapechar\m@ne

447 % \getanddefine@fonts{\csname c@mv@\math@version\endcsname}#3% We globally select the math fonts...

```
448 % \globaldefs\@ne \math@fonts
```

... and close the group to restore \globaldefs and \escapechar.

```
449 % \endgroup
```

As long as no size or version change occurs the  $\langle math\ alphabet\ identifier \rangle$  should simply switch to the installed  $math\ group$  instead of calling \select@group unnecessarily. So we globally redefine the first argument (the new  $\langle math\ alphabet\ identifier \rangle$ ) to expand into a \mathgroup switch and then select this alphabet. Note that this redefinition will be overwritten by the next call to a version macro. The original code for the end of \select@group was

```
\gdef#1{#3\mathgroup #2}#1\fi}
```

i.e. first redefining the  $\langle math \ alphabet \ identifier \rangle$  and then calling the new definition to switch to the wanted  $\langle math \ group \rangle$ . Now we define the  $\langle math \ alphabet \ identifier \rangle$  as a call to the \use@mathgroup command.

But this is not sufficient, as we learned the hard way. The problem here is that the loading of the fonts that comprise the alphabet identifier #1, as well as the necessary math font assignments is deferred until it is used. This is OK so far, but if the fonts are switched within the current formula (which may happen if a sub-formula is a box that contains a math version switch) the font assignments for #1 are not restored unless #1 is used again. This is disastrous since TeX sees the wrong fonts at the end of the math formula, when it converts the math list into a horizontal list.

This is taken into account as follows: When a math alphabet identifier is used for the first time in a certain version it modifies the corresponding macro  $\mbox{\tt mvQ}(\mbox{\tt version})$  so that it calls  $\mbox{\tt getanddefineQfonts}$  directly in future as well. We use the macro  $\mbox{\tt extractQalphQfromQversion}$  to do this. It takes the math alphabet identifier #1 and the math version macro as arguments.

```
452 % \expandafter\extract@alph@from@version
453 % \csname mv@\math@version\expandafter\endcsname
454 % \expandafter\number\csname c@mv@\math@version\endcsname}%
455 % #1%
456 % \stepcounter{mv@\math@version}%
```

Finally, it is not possible to simply call the new definition since we have an argument (the third argument of \use@mathgroup or more exactly the argument od \math@egroup if the margid option is in force) which would swallow our closing \fi. So we use the \expandafter technique to remove the \fi before the \use@mathgroup is expanded.

```
457 %\expandafter #1\fi}
```

\extract@alph@from@version

We proceed to the definition of the macro \extract@alph@from@version. As stated above, it takes a math alphabet identifier and a math version macro (e.g. \mv@normal) as its arguments.

```
458 \ensuremath{\mbox{\mbox{$\mbox{$}$}}\ensuremath{\mbox{$}}} 1\#2\#3\{\% \ensuremath{\mbox{\mbox{$\mbox{$}$}}\ensuremath{\mbox{$}}} 1\#2\#3\{\% \ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbox{$}}\ensuremath{\mbo
```

To extract and replace the definition of math alphabet identifier #3 in macro #1 we have to recall how this definition looks like: Somewhere in the replacement

text of #1 there is the sequence

```
\install@mathalphabet\( math alphabet identifier \) #3{\% \( Definitions for \) #3}
```

Hence, the first thing we do is to extract the tokens preceding this definitions, the definition itself, and the tokens following it. To this end we define one auxiliary macro \reserved@a.

```
459 \def\reserved@a##1\install@mathalphabet#3##2##3\@nil{%
```

When \reserved@a is expanded, it will have the tokens preceding the definition in question in its first argument (##1), the following tokens in its third argument (##3), and the replacement text for the math alphabet identifier #3 in its second argument. (##2). This is then recorded for later use in a temporary macro \reserved@b.

```
460 \def\reserved@b{##2}%
```

Additionally, we define a macro \reserved@c to reconstruct the definitions for the math version in question from the tokens that will remain unchanged (##1 and ##3) and the yet to build new definitions for the math alphabet identifier #3.

```
461 \def\reserved@c###1{\gdef#1{##1###1##3}}}%
```

Then we execute our auxiliary macro.

```
462 \expandafter\reserved@a#1\@nil
```

OK, so now we have to build the new definition for #3. To do so, we first extract the interesting parts out of the old one. The old definition looks like:

```
\sl = 1
```

```
\langle math\ group\ number \rangle \langle math\ extra\ part \rangle
```

```
⟨curr@fontshape definition⟩
```

So we define a new temporary macro \reserved@a that extracts these parts.

```
463 \def\reserved@a\select@group#3##1##2\@nil{%
```

This macro can now directly rebuild the math version definition by calling \reserved@c:

```
464 \reserved@c{%

465 \getanddefine@fonts{#2}##2%

466 \install@mathalphabet#3{%

467 \relax\ifmmode \else \non@alpherr#3\fi

468 \use@mathgroup##1{#2}}}%
```

In addition it defines the alphabet the way it should be used from now on.

```
469 \gdef#3{\relax\ifmmode \else \non@alpherr#3\fi
470 \use@mathgroup##1{#2}}}%
```

Finally, we only have to call this macro \reserved@a on the old definitions recorded in \reserved@b:

```
471 \expandafter\reserved@a\reserved@b\@nil 472 }
```

\math@bgroup
\math@egroup

Here are the default definitions for \math@bgroup and \math@egroup. We use \bgroup instead of \begingroup to avoid 'leaking out' of style changes. This has the side effect of always producing mathord atoms.

```
473 \let\math@bgroup\bgroup
474 \def\math@egroup#1{#1\egroup}
```

```
\calculate@math@sizes Here is the default definition for \calculate@math@sizes a more elaborate inter-
                            face is under testing in mthscale.sty.
                            475 \gdef\calculate@math@sizes{%
                                 \Ofont@info{Calculating\space math\space sizes\space for\space
                            477

                                   \color@endgroup}}
```

XeTeX version. When using system fonts XeTeX reports consecutive runs of characters as a single item in box logging, which means the standard \showhyphens does not work. This version typesets the text into a narrow box to force hyphenation and then reconstructs a horizontal list with explicit hyphens to generate the display. Note that the lmr OpenType font is forced, this works even if the characters are not in the font as hyphenation is attempted due to the width of the space and hyphen character. It may generate spurious Missing Character warnings in the log, these are however suppressed from the terminal output by ensuring that \tracingonline is locally zero.

# ltfsstrc.dtx

## 28 Introduction

This package contains the code for tracing font loading and font changes. It basically overlays some of the low-level functions of NFSS with additional code used for tracing.

The package accepts the following options:

**errorshow** Write all information about font changes etc. only to the transcript file unless an error happens. This means that information about font substitution will not be shown on the terminal.

warningshow Show all NFSS warnings on the terminal. This setting corresponds to the default behaviour of NFSS if the tracefut package is not loaded!

infoshow Show all NFSS warning and all NFSS info messages (that are normally only written to the transcript file) also on the terminal. This is the default if the tracefnt package is loaded.

**debugshow** In addition to **infoshow** show also changing of math fonts as far as possible (this option can produce a large amount of output.

**loading** Show the name of external fonts when they are loaded. This option shows only "newly" loaded fonts not those already preloaded in the format or the class file before the tracefnt package became active.

pausing Turn all font warnings into errors so that LATEX will stop.

## 29 A driver for this document

The next bit of code contains the documentation driver file for TEX, i.e., the file that will produce the documentation you are currently reading. It will be extracted from this file by the DocStrip program.

When this file is processed directly by LATEX this will produce the documentation as well.

```
1 (*driver)
2 \documentclass{ltxdoc}
3
4
5 %\OnlyDescription % comment out for implementation details
6
7 \begin{document}
8  \DocInput{ltfsstrc.dtx}
9 \end{document}
10 (/driver)
```

# 30 The Implementation

Warning: Read the macro documentation with a grain of salt. It is still basically the documentation from the first NFSS release and therefore in some cases probably not completely accurate.

If we are making a package file it is a good idea to test whether we are running under 2e. This code is actually placed at the very beginning of this file for easier maintenance, thus commented out here.

```
11 \langle *package \rangle
12 \langle *package \rangle
13 \langle *package \{ tracefnt \} [??/??/?? v?.??]
14 \langle *package \}
Standard LaTeX package (font tracing)]
```

The debug module makes use of commands contained in a special package file named trace.sty.<sup>4</sup>

```
16 (+debug) \input trace.sty
```

# 31 Handling Options

\tracingfonts

Here is the definition of the integer register for the font trace. As a default in a package file we use 1 to give error messages if fonts are substituted. If this code is used for debugging or tracing reasons in the format file (i.e. in fam.dtx) we use 0 as the default. But if no font trace is used we build a definition that will produce a warning message.

```
17 \(^*2ekernel\)
18 \def\tracingfonts{\('\)}
19 \QfontQwarning{Command \noexpand\tracingfonts}
20 not provided.\MessageBreak
21 Use the 'tracefnt' package.\MessageBreak Command found:}\('\)
22 \countQ\}
23 \('/2ekernel\)
```

The \count@ in the line above will remove the number after \tracingfonts. Note that this definition will be overwritten be the next line if one of these modules are included.

```
24 (*package, trace, debug)
25 \newcount\tracingfonts
26 \tracingfonts=0
27 (/package, trace, debug)
```

The option errorshow turns off all warnings so that only real errors are shown. warningshow corresponds to the NFSS default (when tracefnt is not loaded). infoshow is the default for this package here; and debugshow, loading, and pausing extend the amount of information even further.

<sup>&</sup>lt;sup>4</sup>This package is not in distribution at the moment (and probably doesn't any longer work). Think of this part of the code as being historical artefacts.

```

   We also need a default definition inside the kernel:
73 (*2ekernel)
74 \ensuremath{\def\@font@info\#1{\%}}
75
            \GenericInfo{(Font)\@spaces\@spaces\space\space}%
                        {LaTeX Font Info: \space\space\space#1}}%
77 \def\@font@warning#1{%
78
            \GenericWarning{(Font)\@spaces\@spaces\space\space\%
```

# 32 Macros common to fam.tex and tracefnt.sty

In the first versions of tracefnt.dtx some macros of fam.dtx<sup>5</sup> were redefined to included the extra tracing information. Now these macros are all defined in this file (i.e. removed from fam.dtx) and different production versions can be obtained simply by specifying a different set of modules to include when generating ltfss.dtx.

## 32.1 General font loading

\extract@font

This macro organizes the font loading. It first calls \get@external@font which will return in \external@font the name of the external font file (the .tfm) as it was determined by the NFSS tables.

```
81 \( *2ekernel | package \)
82 \( def \extract@font{%}
83 \\ get@external@font
```

Then the external font is loaded and assigned to the font identifier stored inside \font@name (for this reason we need \expandafter).

84 \global\expandafter\font\font@name\external@font\relax

When tracing we typeout the internal and external font name.

Finally we call the corresponding "loading action" macros to finish things. First the font is locally selected to allow the use of \font inside the loading action macros.

```
90 \font@name \relax
```

The next two lines execute the "loading actions" for the family and then for the individual font shape.

```
91 \csname \f@encoding+\f@family\endcsname

92 \csname\curr@fontshape\endcsname

93 \relax

94 }

95 \(\frac{2\end{e}\end{e}\end{e}\)
```

The \relax at the end needs to be explained. This is inserted to prevent TeX from scanning too far when it is executing the replacement text of the loading code macros.

\get@external@font

This function tries to find an external font name. It will place the name into the macro \external@font. If no font is found it will return the one that was defined via \DeclareErrorFont.

```
96 (*2ekernel)
97 \def\get@external@font{%
```

<sup>&</sup>lt;sup>5</sup>This file is currently not distributed in documented form. Its code is part of ltfss.dtx.

We don't know the external font name at the beginning.

```
98 \let\external@font\@empty
99 \edef\font@info{\expandafter\expandafter\expandafter\string
100 \csname \curr@fontshape \endcsname}%
101 \try@size@range
```

If this failed, we'll try to substitute another size of the same font. This is done by the \try@size@substitution macro. It "knows about" \do@extract@font, \font@name, \f@size, and so on.

```
102
      \ifx\external@font\@empty
103
          \try@size@substitution
104
          \ifx\external@font\@empty
             \@latex@error{Font \expandafter \string\font@name\space
105
                          not found}\@eha
106
107
             \error@fontshape
             \get@external@font
108
      \fi\fi
109
110 }
111 (/2ekernel)
```

\selectfont

The macro \selectfont is called whenever a font change must take place.

```
112 (*2ekernel | package)
113 \DeclareRobustCommand\selectfont
```

When debug is specified we actually want something like 'undebug'. The font selection is now stable so that using \tracingall on some other macros will show us a lot of unwanted information about font loading. Therefore we disable tracing during font loading as long as \tracingfonts is less than 4.

```
115 (+debug) \pushtracing
116 (+debug) \ifnum\tracingfonts<4 \tracingoff
117 (+debug) \else \tracingon\p@selectfont \fi</pre>
```

If \baselinestretch was redefined by the user it will not longer match its internal counterpart \f@linespread. If so we call \set@fontsize to prepare \size@update.

```
118 \ifx\f@linespread\baselinestretch \else
119 \set@fontsize\baselinestretch\f@size\f@baselineskip \fi
```

Then we generate the internal name of the font by concatenating family, series, shape, and current size, with slashes as delimiters between them. This is much more readable than standard LATEX's \twfbf, etc. We define \font@name globally, as always. The reason for this is explained later on.

```
120 \xdef\font@name{%
121 \csname\curr@fontshape/\f@size\endcsname}%
```

We call the macro \pickup@font which will load the font if necessary.

```
122 \pickup@font
Then we select the font.
```

123 \font@name

If \tracingfonts is greater than 2 we also show the font switch. We do this before \glb@settings is called since this macro might redefine \font@name.

```
124 (*trace)
```

```
125
       \ifnum \tracingfonts>\tw@
126
          \@font@info{Switching to \font@name}\fi
127 (/trace)
```

Finally we call \sizeQupdate. This macro is normally empty but will contain actions (like setting the \baselineskip) that have to be carried out when the font size, the base \baselineskip or the \baselinestretch have changed.

```
128
       \size@update
```

A similar function is called to handle anything related to encoding updates. This one is changed from \relax by \fontencoding.

```
\enc@update
```

Just before ending this macro we have to pop the tracing stack if it was pushed before.

```
130 (+debug) \poptracing
131
       }
```

\set@fontsize

The macro \set@fontsize does the actual work. First it assigns new values to \f@size, \f@baselineskip and \f@linespread.

```
132 \def\set@fontsize#1#2#3{%
       \@defaultunits\@tempdimb#2pt\relax\@nnil
133
       \edef\f@size{\strip@pt\@tempdimb}%
134
135
       \@defaultunits\@tempskipa#3pt\relax\@nnil
136
       \edef\f@baselineskip{\the\@tempskipa}%
       \edef\f@linespread{#1}%
```

For backward compatibility and for later testing within \selectfont the internal value of \f@linespread is passed back to \baselinestretch.

```
\let\baselinestretch\f@linespread
```

Additional processing will happen within \selectfont. For this reason the macro \sizeQupdate (which will be called in \selectfont) will be defined to be:

```
\def\size@update{%
```

First calculate the new \baselineskip and also store it in normalbaselineskip

```
\baselineskip\f@baselineskip\relax
140
141
           \baselineskip\f@linespread\baselineskip
142
           \normalbaselineskip\baselineskip
then to set up a new \strutbox
143
           \setbox\strutbox\hbox{%
```

```
144
             \vrule\@height.7\baselineskip
                   \@depth.3\baselineskip
145
                   \width\z0%
146
```

```
We end with a bit of tracing information.
147 (*trace)
      \  \in \ \tracingfonts>\tw0
148
          \ifx\f@linespread\@empty
149
            \let\reserved@a\@empty
150
          \else
151
152
            \def\reserved@a{\f@linespread x}%
153
          \OfontOinfo{Changing size to \fOsize/\reservedOa
154
                     \f@baselineskip}%
          \aftergroup\type@restoreinfo \fi
156
157 (/trace)
```

File p: ltfsstrc.dtx Date: 2015/02/21 Version v3.0k

When all this is processed \size@update redefines itself to \relax so that in later calls of \selectfont no extra code will be executed.

```
158 \let\size@update\relax}%
159 }
```

Instead of defining this macro internally we might speed things up by placing the code into a separate macro and use **\let!** 

\size@update

Normally this macro does nothing; it will be redefined by \set@fontsize to initiate an update.

160 \let\size@update\relax

\type@restoreinfo

This macro produces some info when a font size and/or baseline change will get restored.

```
161 (*trace)
      \def\type@restoreinfo{%
162
          \ifx\f@linespread\@empty
163
164
            \let\reserved@a\@empty
165
          \else
166
            \def\reserved@a{\f@linespread x}%
167
          fi
          \@font@info{Restoring size to
168
                     \f@size/\reserved@a\f@baselineskip}}
169
170 (/trace)
```

\glb@settings \glb@currsize

The macro \glb@settings globally selects all math fonts for the current size if necessary.

```
171 \def\glb@settings{%
```

When \glb@settings gains control a size change was requested and all previous font assignments need to be replaced. Therefore the old values of the fonts are no longer needed. For every math group the new assignments are appended to \math@fonts. But this happens only if the math@fonts switch is set to true. However, we always set up the correct math sizes for script and scriptscript fonts since they may be needed even if we don't set up the whole math machinery.

Here we set the math size, script size and scriptscript size. If the SQ... macro is not defined we have to first calculate the three sizes.

```
172 \expandafter\ifx\csname S@\f@size\endcsname\relax
173 \calculate@math@sizes
174 \fi
```

The effect of this is that \calculate@math@sizes may or may not define the S@... macro. In the first case the next time the same size is requested this macro is used, otherwise \calculate@math@sizes is called again. This also sets the math@fonts switch. If it is true we must switch the math fonts.

```
175 \csname S@\f@size\endcsname
176 \ifmath@fonts
177 \langle*trace\
178 \ifnum \tracingfonts>\tw@
179 \@font@info{Setting up math fonts for
180 \f@size/\f@baselineskip}\fi
181 \/trace\
```

Inside a group we execute the macro for the current math *version*. This sets  $\mathbb{Z}$  was defined a list of  $\mathbb{Z}$  assignments.  $\mathbb{Z}$  which may be called at this point) needs the  $\mathbb{Z}$  needs are parameter to be set to -1.

```
182 \begingroup
183 \escapechar\m@ne
184 \csname mv@\math@version \endcsname
```

Then we set \globaldefs to 1 so that all following changes are done globally. The math font assignments recorded in \math@fonts are executed and \glb@currsize is set equal to \f@size. This signals that the fonts for math in this size are set up.

```
185 \globaldefs\@ne
186 \math@fonts
187 \let \glb@currsize \f@size
188 \endgroup
```

Finally we execute any code that is supposed to happen whenever the math font setup changes. This register will be executed in local mode which means that everything that is supposed to have any effect should be done globally inside. We can't execute it within \globaldefs\@ne as we don't know what ends up inside this register, e.g., it might contain calculations which use some local registers to calculate the final (global) value.

```
189 \the\every@math@size
```

Otherwise we announce that the math fonts are not set up for this size.

\baselinestretch

In \selectfont we used \baselinestretch as a factor when assigning a value to \baselineskip. We use 1 as a default (i.e. no stretch).

```
199 (*2ekernel)
200 \def\baselinestretch{1}
```

\every@math@size

We must still define the hook \every@math@size we used in \glb@settings. We initialize it to nothing. It is important to remember that everything that goes into this hook should to global updates, local changes will have weird effects.

```
201 \newtoks\every@math@size 202 \every@math@size={} 203 \langle/2ekernel\rangle
```

### 32.2 Math fonts setup

## 32.2.1 Outline of algorithm for math font sizes

TEX uses the the math fonts that are current when the end of a formula is reached. If we don't want to keep font setups local to every formula (which would result in

an enormous overhead, we have to be careful not to end up with the wrong setup in case formulas are nested, e.g., we need to be able to handle

#### 

Here the inner formulae b and c\in Z are typeset in \small but we have to return to \normalsize before we reach the closing \$ of the outer formula.

This is handled in the following way:

- 1. At any point in the document the global variable \gbl@currsize contains the point size for which the math fonts currently are set up.
- 2. Whenever we start a formula we compare its value with the local variable \f@size that describes the current text font size.
- 3. If both are the same we assume that we can use the current math font setup without adjustment.
- 4. If they differ we call \gbl@settings which changes the math font setup and updates \gbl@currsize.
  - (a) If we are recursively inside another formula (\if@inmath) we ensure that \gbl@settings is executed again in the outer formula, so that the old setup is automatically restored.
  - (b) Otherwise, we set the switch @inmath locally to true so that all nested formulae will be able to detect that they are nested in some outer formula.

The above algorithm has the following features:

- For sizes which are not containing any formula no math setup is done. Compared to the original algorithm of NFSS this results in the following savings:
  - No unnecessary loading of math fonts for sizes that are not used to typeset any math formulae (explicit or implicit ones).
  - No time overhead due to unnecessary changes of the math font setup on entrance and exit of the text font size.
- Math font setup changes for top-level formulae will survive (there is no restoration after the formula) thus any following formula in the same size will be directly typesetable. Compared to original implementation in NFSS2 the new algorithm has the overhead of one test per formula to see if the current math setup is valid (in the original algorithm the setup was always valid, thus no test was necessary).
- In nested formulae the math font setup is restored in the outer formula by a series of \aftergroup commands and checks. Compared to the original algorithm this involves additional checks  $(2 \times \langle \text{non-math levels} \rangle)$  per inner formula).

#### 32.2.2 Code for math font size setting

\check@mathfonts In the \check@mathfonts macros we implement the steps 2 to 4 except that instead of a switch the macro \init@restore@glb@settings is used. 204 (\*2ekernel | package) 205 \def\check@mathfonts{% \ifx \glb@currsize \f@size 206 207 (\*trace) \ifnum \tracingfonts>\thr@@ 208 \OfontOinfo{\*\*\* MATH: no change \fOsize\space 209 210 curr/global (\curr@math@size/\glb@currsize)}\fi 211 (/trace) \else 212 213 (\*trace) 214 \ifnum \tracingfonts>\thr@@ \OfontOinfo{\*\*\* MATH: setting up \fOsize\space 215 curr/global (\curr@math@size/\glb@currsize)}\fi 216 217 (/trace) \glb@settings 218 \init@restore@glb@settings 219 220 \let\curr@math@size\f@size 221 \def\init@restore@glb@settings{\aftergroup\restglb@settings}% 222 223 } \init@restore@glb@settings This macros does by default nothing but get redefined inside \check@mathfonts to initiate fontsize restoring in nested formulas. 224  $\langle -trace \rangle \cdot let \cdot init@restore@glb@settings \cdot relax$  $225 \langle *trace \rangle$ 227 \ifnum \tracingfonts>\thr@@ 228 \OfontOinfo{\*\*\* MATH: no resetting (not in 229 nested math)}\fi 230 }  $231 \langle / trace \rangle$ \restglb@settings This macro will be executed the first time after the current formula. 232 \def\restglb@settings{% 233 (\*trace) \ifnum \tracingfonts>\thr@@ 234 \@font@info{\*\*\* MATH: restoring}\fi 235 236 (/trace) 237\begingroup 238 \let\f@size\curr@math@size \ifx\glb@currsize \f@size 239 240 (\*trace) \ifnum \tracingfonts>\thr@@ 241 242 \OfontOinfo{\*\*\* MATH: ... already okay (\fOsize)}\fi  $243 \langle / trace \rangle$ 244 \else  $245 \langle *trace \rangle$ \ifnum \tracingfonts>\thr@@ 247 \OfontOinfo{\*\*\* MATH: ... to \fOsize}\fi  $248 \langle / trace \rangle$ 

```
249 \glb@settings
250 \fi
251 \endgroup
252 }
```

#### 32.2.3 Other code for math

\use@mathgroup

The \use@mathgroup macro should be used in user macros to select a math group. Depending on whether or not the margid option is in force it has two or three arguments. For this reason it should be called as the last macro.

First we test if we are inside math mode since we don't want to apply a useless definition.

253 \def\use@mathgroup#1#2{\relax\ifmmode

```
254 (*trace)
255 \ifnum \tracingfonts>\tw0
256 \count@#2\relax
257 \@font@info{Using \noexpand\mathgroup
258 (\the\count0) #2}\fi
259 \(/trace\)
```

If so we first call the '=' macro (i.e. argument three) to set up special things for the selected math group. Then we call \mathgroup to select the group given by argument two and finally we place #1 (i.e. the argument of the \( \frac{math alphabet identifier} \) at the end. This part of the code is surrounded by two commands which behave like \begingroup and \endgroup if we want \( \frac{math alphabet identifier} \) sbut will expand into \( \text{Qempty} \) if we want simply switches to a new math group. Since argument number 2 may be a digit instead of a control sequence we add a \relax. Otherwise something like \mit{1}\) would switch to math group 11 (and back) instead of printing an oldstyle 1.

```
260 \math@bgroup
261 \expandafter\ifx\csname M@\f@encoding\endcsname#1\else
262 #1\fi
263 \mathgroup#2\relax
```

Before we reinsert the swallowed token (arg. three) into the input stream, in the case that the  $\langle math \ alphabet \ identifier \rangle$  isn't called in math mode, we remove the fi with the expandafter trick. This is necessary if the token is actually an macro with arguments. In such a case the fi will be misinterpreted as the first argument which would be disastrous.

```
264 \expandafter\math@egroup\fi}%
```

The surrounding macros equal  $\ensuremath{\verb|begingroup|}$  and  $\ensuremath{\verb|cndgroup|}$ . But using internal names makes it possible to overwrite their meaning in certain cases. This is for example used in  $\mathcal{A}_{\mathcal{M}}\mathcal{S}$ -TEX macros for placing accents.

\math@egroup

If the margid option is in force (which can be tested by looking at the definition of \math@bgroup we change the \math@egroup command a bit to display the current  $\langle math\ group\ number \rangle$  after it closes the scope of  $\langle math\ alphabet \rangle$  with \endgroup.

```
265 (*trace)
266 \ifx\math@bgroup\bgroup
267 \def\math@egroup#1{#1\egroup
```

```
268 \ifnum \tracingfonts>\tw@
269 \@font@info{Restoring \noexpand\mathgroup
270 (\ifnum\mathgroup=\m@ne default\else \the\mathgroup \fi)%
271 }\fi
272 \fi
273 \/trace\
```

#### \getanddefine@fonts

\getanddefine@fonts has two arguments: the  $\langle math\ group\ number \rangle$  and the family/series/shape name as a control sequence.

#### 274 \def\getanddefine@fonts#1#2{%

First we turn of tracing when \tracingfonts is less than 4.

```
275 (+debug)
               \pushtracing
               \verb|\ifnum| tracing fonts<4 | tracing off
276 (+debug)
277 (+debug)
               \else \tracingon\getanddefine@fonts \fi
278 (*trace)
279
      \ifnum \tracingfonts>\tw@
280
      \count@#1\relax
        \label{lem:count_one} $$ \end{\mathrm{mathgroup}} (\he\count_0) $$\#1 :=\MessageBreak $$
281
                    \string#2 \tf@size/\sf@size/\ssf@size}\fi
282
283 (/trace)
```

We append the current \tf@size to #2 to obtain the font name.<sup>6</sup> Again, font@name is defined globally, for the reasons explained in the description of \wrong@fontshape.

284 \xdef\font@name{\csname \string#2/\tf@size\endcsname}%

Then we call \pickup@font to load it if necessary. We remember the internal name as \textfont@name.

285 \pickup@font \let\textfont@name\font@name

Same game for \scriptfont and \scriptscriptfont:

```
286 \xdef\font@name{\csname \string#2/\sf@size\endcsname}%
287 \pickup@font \let\scriptfont@name\font@name
```

 ${\tt 288 } \verb| xdef\font@name{\csname } $\%$ ize\endcsname} % $$$ 

289 \pickup@font

Then we append the new \textfont... assignments to the \math@fonts.

```
290 \edef\math@fonts{\math@fonts
291 \textfont#1\textfont@name
292 \scriptfont#1\scriptfont@name
293 \scriptscriptfont#1\font@name}%
```

Just before ending this macro we have to pop the tracing stack if it was pushed before.

```
294 \langle +debug \rangle \poptracing
295 }
296 \langle /2ekernel \mid package \rangle
```

<sup>&</sup>lt;sup>6</sup>One might ask why this expansion does not generate a macro name that starts with an additional \character. The solution is that \escapechar is set to -1 before \getanddefine@fonts is called.

#### Scaled font extraction 33

\ifnot@nil

We begin with a simple auxiliary macro. It checks whether its argument is the token \@nil. If so, it expands to \@gobble which discards the following argument, otherwise it expands to \Offirstofone which reproduces it argument.

```
297 (*2ekernel)
298 \def\ifnot@nil#1{\def\reserved@a{#1}%
     \ifx\reserved@a\@nnil \expandafter\@gobble
     \else \expandafter\@firstofone\fi}
```

\remove@to@nnil \remove@angles \remove@star Three other auxiliary macros will be needed in the following: \remove@to@nnil gobbles up everything up to, and including, the next \@nnil token, and \remove@angles and \remove@star do the same for the character > and \*, respectively, instead of \Onnil.

```
301 \def\remove@to@nnil#1\@nnil{}
302 \def\remove@angles#1>{\set@simple@size@args}
303 \def\remove@star#1*{#1}
```

\extract@sizefn This macro takes a size specification and parses it into size function and the optional and mandatory arguments.

```
304 \def\extract@sizefn#1*#2\@nil{%
305
     \if>#2>\set@size@funct@args#1\@nil
            \let\sizefn@info\@empty
306
     \else\expandafter\set@size@funct@args\remove@star#2\@nil
307
          \def\sizefn@info{#1}\fi
308
     }
309
```

\try@simple@size

This function tries to extract the given size (specified by \fosize) for the requested font shape. The font information must already be present in \font@info. The central macro that does the real work is \extract@fontinfo. We will first give a simple example how this macro works, and describe it in full generality later.

Assume that the requested parameters are: encoding scheme 'OT1', family 'cm', series 'sansserif', shape 'normal', and size '12'. The corresponding font definitions have already been extracted from the macro \OT1/cm/sansserif/normal and stored in font@info. (Otherwise \extract@fontinfo doesn't get called.) This information consists of a token list made of characters of category code 12 of the form

```
<10*>cmss10<12*>cmss12<17*>cmss17
```

For reasonable packages one usually needs more sizes but this is sufficient to get the flavour. We will define a macro \extract@fontinfo to find the external font name ('cmss12') for us:

```
\def\extract@fontinfo#1<12*#2>#3<#4\@nnil{%
    \set@simple@size@args#3<#4\@nnil
    \execute@size@function{#2}}
```

so that when it gets called via

\extract@fontinfo<10\*>cmss10<12\*>cmss12<17\*>cmss17\@nnil

#1 will contain all characters before <12\*>, #2 will be empty, #3 will be exactly cmss12, and #3 will be 17>cmss17. The expansion is therefore

```
\set@simple@size@args cmss12<17*>cmss17\@nnil
\execute@size@function{}
```

This means: the default (empty) size function will be executed, with its optional argument argument set to empty and its mandatory argument set to cmss12 by \set@simple@size@args. As we discussed earlier, the effect of the default size function is to load the given external font (cmss12) at the specified size (12)—which is exactly what was intended.

But this is only part of the whole story. It may be that the size requested does not occur in the token list \font@info. And the simple definition of \extract@fontinfo we gave above does not allow to specify give more than one size specification in front of the external font name.

Let's address these two problems separately. The first one is solved with the following trick: We define \extract@fontinfo as follows:

```
\def\extract@fontinfo#1<12*#2>#3<#4\@nnil{%
\ifnot@nil{#3}%
    {\set@simple@size@args#3<#4\@nnil
    \execute@size@function{#2}%
}}%</pre>
```

How does this work? We call \extract@fontinfo via

\expandafter\extract@fontinfo\font@info<12\*>\@nil<\@nnil

i.e. by appending <12\*>\@nil<\@nnil. If the size ('12' in this case) appears in \font@info everything works as explained above, the only difference being that argument #4 of \extract@fontinfo additionally gets the tokens <12\*>\@nil<\@nnil. However, if the size is not found everything up to the final <12\*> is in argument #1, #3 gets \@nil, and #2 and #4 are empty. The macro \ifnot@nil will discard the calls to \set@simple@size@args and execute@size@function, and hence \font@info will continue to be equal to \@empty. This means that no simple size specification matching the requested size could be found.

The second problem (more than one simple size specification for one external font name) will be addressed in \set@simple@size@args below.

The macros are hidden inside other control sequences so that we have to build \extract@fontinfo in several steps.

So here's the actual definition of \extract@font in \try@simple@size.

 $310\ \%$  % this could be replaced by \try@size@range making the subst slower!  $311\\def\try@simple@size{\%}$ 

\reserved@a is made an abbreviation for the head of the definition of the macro \extract@fontinfo.

```
\label{lem:continuous} $312 \qquad \ensuremath{$\backslash$ def\extract@fontinfo\#\#\#1}\%$
```

Now we can define  $\ensuremath{\texttt{cartQfontinfo}}$ . Here we handle a small but convenient variation: in case of the default (empty) size function it is allowed to omit the \* character.

```
313 \expandafter\reserved@a\expandafter<\f@size>##2<##3\@nnil{%
314 \ifnot@nil{##2}%
```

```
{\set@simple@size@args##2<##3\@nnil
315
                 \execute@size@function\sizefn@info
316
               }}%
317
```

Now we call \extract@fontinfo. Note the <\@nil tokens at the end.

```
\expandafter\expandafter
318
       \expandafter\extract@fontinfo\expandafter\font@info
319
       \expandafter<\f@size>\@nil<\@nnil
320
321 }
```

\set@simple@size@args

As promised above, the macro \set@simple@size@args will handle the case of several size specifications in a row. If another size specification follows, the very first token of its argument list is the character <. By starting the definition as follows,

```
322 \def\set@simple@size@args#1<{%
```

parameter #1 is empty in this case, and contains the size function's arguments otherwise. We distinguish these two cases (Note that the character < cannot appear in #1) by calling \remove@angles for empty #1 and \extract@sizefn otherwise. In the latter case we have to take care of the remaining character tokens and discard them. This is done by \remove@to@nnil. Note also the use of Kabelschacht's method.

```
323
              \if<#1<%
324
                \expandafter\remove@angles
325
              \else
326
                \extract@sizefn#1*\@nil
327
                \expandafter\remove@to@nnil
328
              fi
```

Now, we are through with the case of a simple size, except for calling the size function. This will be handled later, as it is the same mechanism for all types of size specification. We will now proceed to macors for extraction of size range specification.

\extract@rangefontinfo

\extract@rangefontinfo goes through a font shape definition in the input until it recognizes the tokens <\@nil->. It looks for font ranges with font size functions. It's operation is rather simple: it discards everything up to the next size specification and passes this on to \is@range for inspection. The specification (parameter #2 is inserted again, in case it is needed later.

```
329 \def\extract@rangefontinfo#1<#2>{%
          \is@range#2->\@nil#2>}
```

\is@range

\is@range is again a sort of dispatcher macro: if the size specification it is looking at is not a range specification it discards it and calls \extract@rangefontinfo to continue the search. Otherwise it calls \check@range to check the requested size against the specified range.

From the way \is@range is called inside \extract@rangefontinfo we see that #2 is the character > if the size specification found is a simple one (as it does not contain a - character. This is checked easily enough and \extract@rangefontinfo called again. Note that the extra tokens inserted after the \Onil in the call to \isOrange appear at the beginning of the first argument to \extract@rangefontinfo and are hence ignored.

```
331 \def\is@range#1-#2\@nil{%
332 \if>#2\expandafter\check@single\else
333 \expandafter\check@range\fi}
```

\check@range

\check@range takes lower bound as parameter #1, upper bound as #2, size function as #3 and the size function's arguments as #4. If #3 is the special token \@nil\font@info is exhausted and we can stop searching.

```
334 \def\check@range#1-#2>#3<#4\@nnil{%
335 \ifnot@nil{#3}{%
```

If #3 wasn't \@nil we have a range. We start by assuming that we have to recurse. Note that we have to reinsert an < as it was already removed by scanning.

```
336 \def\reserved@f{\extract@rangefontinfo<#4\@nnil}%
```

We have to make sure that both boundaries are present, if not we have to set them. Here we check the upper bound. If  $\protect\operatorname{upper@bound}$  is zero after the assignment we set it to  $\protect\operatorname{maxdimen}$  (upper open range). We need to use a  $\langle dimen \rangle$  register for the scan since we may have a decimal number as the boundary.

```
337 \upper@bound0#2\p@
338 \ifdim\upper@bound=\z@ \upper@bound\maxdimen\fi
```

Now we check the upper boundary against \f@size. If it is larger or equal than \f@size this range is no good and we have to recurse.

```
339 \ifdim \f@size \p@<\upper@bound
```

Otherwise we have to check the lower bound. This time it is not necessary to scan the boundary value into a register because if it is empty we get zero as desired. We could even omit the 0 which would result in 1pt as default lower boundary. If \fostize is smaller than the boundary we have to recurse.

```
340 \lower@bound0#1\p@
341 \ifdim \f@size \p@<\lower@bound
342 \else
```

If both tests are passed we can try executing the size function.

```
343 \set@simple@size@args#3<#4\@nnil
344 \execute@size@function\sizefn@info
```

If the function was successful it should have left an external font name in \external@font. We use this to see if we can stop scanning. Otherwise we recurse.

```
345 \ifx\external@font\@empty
346 \else
347 \let\reserved@f\@empty
348 \fi
349 \fi
350 \fi
351 \reserved@f\}
```

\lower@bound \upper@bound

We use two dimen registers \lower@bound and \upper@bound to store the lower and upper endpoints of the range we found.

```
352 \newdimen\lower@bound
353 \newdimen\upper@bound
```

\check@single

\check@single takes the size as parameter #1, size function as #2 and the size function's arguments as #3. We can assume that there is always something in the pipeline since the very last entry is a faked range (see above).

```
354 \def\check@single#1>#2<#3\@nnil{%
```

We start by assuming that we have to recurse. Note that we have to reinsert an < as it was already removed by scanning.

```
355 \def\reserved@f{\extract@rangefontinfo<#3\@nnil}%
```

Now we check the the size against \f@size. If it is not equal \f@size it is no good and we have to recurse.

```
356 \ifdim \f@size \p@=#1\p@
```

Otherwise if this test is passed we can try executing the size function.

```
357 \set@simple@size@args#2<#3\@nnil
358 \execute@size@function\sizefn@info
```

If the function was successful it should have left an external font name in \external@font. We use this to see if we can stop scanning. Otherwise we recurse.

```
359 \ifx\external@font\@empty
360 \else
361 \let\reserved@f\@empty
362 \fi
363 \fi
364 \reserved@f\
```

\set@size@funct@args \set@size@funct@args@ This macro sets the optional and mandatory arguments for a size function. If the optional argument is not present it is set to the empty token list. The mandatory argument is delimited by the token \Onil.

```
365 \def\set@size@funct@args{\@ifnextchar[%
366 \set@size@funct@args@{\set@size@funct@args@[]}}
367 \def\set@size@funct@args@[#1]#2\@nil{%
368 \def\mandatory@arg{#2}%
369 \def\optional@arg{#1}}
370 \/2ekernel\
```

\DeclareSizeFunction

This function defines a new size function hiding the internal from the designer. The body of the size function may use \optional@arg and \mandatory@arg denoting the optional and mandatory argument that may follow the size specification <...>.

```
371 (*2ekernel)
372 \def\DeclareSizeFunction#1#2{\@namedef{s@fct@#1}{#2}}
373 \@onlypreamble\DeclareSizeFunction
374 (/2ekernel)
```

\execute@size@function

This macro is very simple. The only point worth noting is that calling an undefined size function will do nothing (actually execute a \relax).

```
375 \*2ekernel | package\)
376 \def\execute@size@function#1{%
377 \rangle *trace\)
378 \@ifundefined{s@fct@#1}%
379 \{\errmessage{Undefined font size function #1}%
```

```
380 \s@fct@}%
381 {\csname s@fct@#1\endcsname}%
382 \/\trace\
383 \race\ \csname s@fct@#1\endcsname
384 }
385 \/\2ekernel | package\
```

\try@size@range

This macro tries to find a suitable range for requested size (specified by \f@size) in \font@info. All the relevant action is done in \extract@rangefontinfo. All that needs to be done is to stuff in the token list in \font@info so that \extract@rangefontinfo can inspect it. Note the <-\*\@nil>< token at the end to stop scanning.

```
386 (*2ekernel)
387 \def\try@size@range{%
388 \expandafter\extract@rangefontinfo\font@info <-*>\@nil<\@nnil
389 }
```

\try@size@substitution

This is the last thing that can be tried. If the desired \footnote{fosize} is found neither among the simple size specifications nor in one of the ranges the whole list of size specifications is searched for a nearby simple size.

```
390 \gdef\try@size@substitution{%
```

First we do some initializations. \Qtempdimb will hold the difference between the wanted size and the best solution found so far, so we initialise it with \maxdimen. The macro \bestQsize will hold the best size found, nothing found is indicated by the empty value.

```
391 \Qtempdimb \maxdimen
392 \let \bestQsize \Qempty

Now we loop over the specification
393 \expandafter \tryQsimples \fontQinfo <\number\QM>\Qnil<\Qnnil
394 }
```

\font@submax \fontsubfuzz The macro \font@submax records the maximal deviation from the desired size encountered so far. Its value is used in a warning message at \end{document}. The macro \fontsubfuzz contains the amount that will not cause terminal warnings (warnings still go into the transcript file).

```
395 \def\font@submax{0pt}
396 \def\fontsubfuzz{.4pt}
397 \langle /2ekernel \rangle
398 \langle +package \def\fontsubfuzz{0pt}
```

\try@simples

\try@simples goes through a font shape definition in the input until it recognizes the tokens <\*\@nil><. It looks for simple sizes to determine the two closest sizes. It is assumed that simple sizes are in increasing order.

```
399 (*2ekernel)
400 \gdef\try@simples#1<#2>{%
401 \tryif@simple#2->\tryif@simple}
```

\tryis@simple

\tryis@simple is similar to \is@range. If it sees a simple size, it checks it against the value of \f@size and sets \lower@font@size or \higher@font@size. In the latter case, it stops the iteration. By adding <\number\@M> at the end of the line we always have an end point. This is a hack which probably should be corrected.

First it checks whether it is finished already, then whether the size specification in question is a simple one.

```
402 \gdef\tryif@simple#1-#2\tryif@simple{%
```

Most common case for \reserved@f first:

```
403 \let \reserved@f \try@simples 404 \if>#2%
```

If so, it compares it to the value of \f@size. This is done using a dimen register since there may be fractional numbers.

```
405 \dimen@ #1\p@
406 \ifdim \dimen@<\@M\p@
```

If \dimen@ is \@M\p@ we have reached the end of the fontspec (hopefully) otherwise we compare the value with \f@size and compute in \@tempdimc the absolute value of the difference between the two values.

```
407 \ifdim \f@size\p@<\dimen@
408 \@tempdimc \dimen@
409 \advance\@tempdimc -\f@size\p@
410 \else
411 \@tempdimc \f@size\p@
412 \advance\@tempdimc -\dimen@
413 \fi
```

The result is then compared with the smallest difference we have encountered, if the new value (in \@tempdimc is smaller) we have found a size which is a better approximation so we make it the \best@size and adjust \@tempdimb.

```
414 \ifdim \@tempdimc<\@tempdimb

415 \@tempdimb \@tempdimc

416 \def \best@size{#1}%

417 \fi
```

When we have reached the end of the fontspec we substitute the best size found (if any). We code this inline to save macro space; in the past this was done by a macro called \subst@size.

```
418 \else
```

\subst@size

This macro substitutes the size recorded in \best@size for the unavailable size \f@size. \font@submax records the maximum difference between desired size and selected size in the whole run.

```
419 % %\subst@size
                               %% coded inline
420 % %\def\subst@size{%
     \ifx \external@font\@empty
421
422
       \ifx \best@size\@empty
423
       \else
         \ifdim \@tempdimb>\font@submax \relax
424
           \xdef \font@submax {\the\@tempdimb}%
425
426
427
         \let \f@user@size \f@size
428
         \let \f@size \best@size
         \ifdim \@tempdimb>\fontsubfuzz\relax
429
           \@font@warning{Font\space shape\space
430
                '\curr@fontshape'\space in\space size\space
431
432
                 <\f@user@size>\space not\space available\MessageBreak
433
                 size\space <\f@size>\space substituted}%
```

```
434 \fi

435 \try@simple@size

436 \do@subst@correction

437 \fi

438 \fi

439 % %}
```

This brings us back into the main part of \tryif@simple. Finally we get rid of any rubbish left over on the input stack.

```
440 \let \reserved@f \remove@to@nnil
441 \fi
442 \fi
If it's a range iterate also.
443 \reserved@f}
```

#### 33.1 Sizefunctions

In the following we define some useful size functions.

\s@fct@

This is the default size function. Mandatory argument is an external font name, optional argument a scale factor. The font is scaled to \fosize if no optional argument is present, and to \fosize multiplied by the optional argument otherwise.

```
444 \DeclareSizeFunction{}{\empty@sfcnt\@font@warning}
445 \DeclareSizeFunction{s}{\empty@sfcnt\@font@info}
446 \ensuremath{\mbox{\sc height}}\ensuremath{\mbox{\sc height}}\ensuremath}\ensuremath{\mbox{\sc height}}\ensuremath{\mbox{\sc height}}\ensuremath{\mbox{\sc height}}\ensuremath}\ensuremath{\mbox{\sc height}}\ensuremath{\mbox{\sc height}}\ensuremath}\ensuremath{\mbox{\sc height}}\ensuremath}\ensuremath{\mbox{\sc height}}\ensuremath}\ensuremath{\mbox{\sc height}}\ensuremath}\ensuremath{\mbox{\sc height}}\ensuremath}\ensuremath{\mbox{\sc height}}\ensuremath}\ensuremath}\ensuremath{\mbox{\sc height}}\ensuremath}\ensuremath}\ensuremath{\mbox{\sc height}}\ensuremath}\ensuremath{\mbox{\sc height}}\ensuremath}\ensuremath}\ensuremath}\ensuremath}\ensuremath}\ensur
                                                      \@tempdimb \f@size\p@
447
                                                      \ifx\optional@arg\@empty
448
449
                                                                 \@tempdimb \optional@arg\@tempdimb
450
                                                                 #1{Font\space shape\space '\curr@fontshape'\space
451
452
                                                                                  will\space be\MessageBreak
453
                                                                                  scaled\space to\space size\space \the\@tempdimb}%
454
                                                      \fi
                                                      \edef\external@font{\mandatory@arg\space at\the\@tempdimb}}
455
```

\s@fct@gen \s@fct@sgen This size function generates the external name from the mandatory argument and the requested user size, and thus can be used for external names where the size is encoded in the font name. The optional argument a scale factor. The font is scaled to \f@size if no optional argument is present, and to \f@size multiplied by the optional argument otherwise.

```
456 \DeclareSizeFunction{gen}{\gen@sfcnt\@font@warning}
457 \DeclareSizeFunction{sgen}{\gen@sfcnt\@font@info}
458 \def\gen@sfcnt{%
459 \edef\mandatory@arg{\mandatory@arg\f@size}%
460 \empty@sfcnt}
```

\s@fct@genb \s@fct@sgenb This size function is similar to gen, but for fonts where the size is encoded in the font name in centipoints, as in the DC fonts version 1.2. The font is scaled to \f@size if no optional argument is present, and to \f@size multiplied by the optional argument otherwise.

```
461 \DeclareSizeFunction{genb}{\genb@sfcnt\@font@warning}
            462 \DeclareSizeFunction{sgenb}{\genb@sfcnt\@font@info}
            463 \ensuremath{\mbox{def\genb@sfcnt}\mbox{\mbox{\%}}}
                    \edef\mandatory@arg{\mandatory@arg\expandafter\genb@x\f@size..\@@}%
            464
                    \empty@sfcnt}
            465
   \genb@x
            The auxiliary macros \genb@x and \genb@y are used to convert the \f@size into
   \genb@y
            centipoints.
            466 \def\genb@x#1.#2.#3\@@{\two@digits{#1}\genb@y#200\@@}
            467 \leq 1427
            This size function handles font substitution. The mandatory argument is a fam-
\s@fct@sub
            ily/series/shape combination, the optional argument (if present) is ignored. The
            font encoding scheme cannot be changed. Therefore, the first thing we do is to
            prepend the encoding scheme.
            468 \DeclareSizeFunction{sub}{\sub@sfcnt\@font@warning}
            469 \DeclareSizeFunction{ssub}{\sub@sfcnt\@font@info}
            470 \def\sub@sfcnt#1{%
                    \edef\mandatory@arg{\f@encoding/\mandatory@arg}%
            471
            Next action is split the arg into its individual components and allow for a late font
            shape load.
            472
                    \begingroup
            473
                     \expandafter\split@name\mandatory@arg/\@nil
            474
                     \try@load@fontshape
            475
                    \endgroup
            Then we record the current \f@size since it may get clobbered.
                    \let\f@user@size\f@size
            Then we check whether this new combination is defined and give an error message
            if not. In this case we also switch to \error@fontshape.
                    \expandafter
            477
                    \ifx\csname\mandatory@arg\endcsname\relax
            478
                      \errmessage{No\space declaration\space for\space
            479
                                   shape\space \mandatory@arg}%
            480
                      \error@fontshape
            481
            482
                    \else
            Otherwise we warn the user about the substitution taking place.
                      #1{Font\space shape\space '\curr@fontshape'\space in\space
            483
                         size\space <\f@size>\space not\space available\MessageBreak
            484
                         Font\space shape\space '\mandatory@arg'\space tried\space
            485
            486
                         instead}%
                      \expandafter\split@name\mandatory@arg/\@nil
            487
            488
            Then we restart the font specification scan by calling \get@external@font.
                    \edef\f@size{\f@user@size}%
                    \get@external@font
            Finally \do@subst@correction is called to get the font name right.
            491
                    \do@subst@correction
```

492 }

\s@fct@subf

The **subf** size function allows substitution of another font. The mandatory argument is the external name of the font to be substituted, the optional argument a size scaling factor like in the default size function. The main difference to the default size function is the warning message.

```
493 \DeclareSizeFunction{subf}{\subf@sfcnt\@font@warning}
494 \DeclareSizeFunction{ssubf}{\subf@sfcnt\@font@info}
495 \def\subf@sfcnt#1{%
496  #1{Font\space shape\space '\curr@fontshape'\space in\space
497  size\space \f@size\space not\space available\MessageBreak
498  external\space font\space '\mandatory@arg'\space used}%
499  \empty@sfcnt#1%
500 }
```

\s@fct@fixed

The fixed size function is for using a font at a different size than requested. A warning message is printed, and the external font to be used is taken from the mandatory argument. If an optional argument is present it is used as the 'at' size for the font. Otherwise the font is loaded at its design size.

```

# File q

# ltfsscmp.dtx

This file contains the implementation of commands giving compatibility with the original 'NFSS1' release of the Font Selection Scheme.

Warning: The macro documentation is still basically the documentation from the first NFSS release and therefore in some cases probably not completely accurate.

Version 1 of NFSS is obsolete now for about 20 years (and was "current" only for a short intermediate time) so with the 2015 release these internal interface commands are removed from the kernel and made available via latexrelease package so that backward compatibility remains ensured for very old documents.

```

```

## File r

# ltfssdcl.dtx

This file contains the main implementation of the font selection scheme commands. See other parts of the  $\LaTeX$  distribution, or *The \LaTeX Companion* for higher level documentation of these commands.

Warning: The macro documentation is still basically the documentation from the first NFSS release and therefore in some cases probably not completely accurate.

## 34 Interface Commands

\ino \@in is a utility macro with two arguments. It determines whether its first argument occurs in its second and sets the switch \ifin@ accordingly. The first argument may not contain braces nor # (more precisely, tokens of category code 1, 2, or 6).

```
_1 \langle *2ekernel \rangle
 2 \def in @#1#2\%
 3 {%
 4
        \begingroup
          \def\in@@##1#1{}%
 5
          \toks@\operatorname{in@@#2{}{}}#1}%
 6
          \ensuremath{\ensuremath{\text{def}\in0{\frac{\pi 0}{\ensuremath{\ensuremath{\text{def}}}}}}
 7
        \expandafter\endgroup
 8
        \ifx\in@@\@empty
 9
          \in@false
10
11
        \else
12
          \in@true
        \fi
13
14 }
15 \newif\ifin@
```

Before the \begin{document} command several \langle math versions \rangle and \langle math alphabet identifiers \rangle may be declared. In principle, there should be exactly one family/series/shape combination be declared for each version/alphabet pair. But we want to allow for defaults as well for automagical filling of holes.

While building the tables for math alphabet identifiers and math versions we keep several lists:

• the list of all math versions, \version@list, each entry prefixed by the control sequence \version@elt, i.e. this list has the following form

```
\verb|\version@elt| \langle version_1 \rangle \\ | \text{version@elt} \langle version_2 \rangle ... \\ | \text{version@elt} \langle version_n \rangle \\
```

197

• the list of all math alphabet identifiers. Here every entry has the form:  $\langle \text{group@elt} \langle \text{math group number} \rangle \\ \{ \langle \text{default family} \rangle \} \{ \langle \text{default series} \rangle \} \{ \langle \text{default shape} \rangle \} \}.$ 

File r: ltfssdcl.dtx Date: 2016/02/18 Version v3.0r

• Each defined math alphabet identifier holds a list containing Information about the versions for which it is defined. This list has a more complicated structure: it looks as follows:

```
\set@alpha\the alphabet identifier itself\
      \ensuremath{\mbox{reserved@c}\langle math\ version \rangle \langle font\ info \rangle}
\@nil
```

where \( \font \info \) is either \reserved@e (if the combination is not defined yet) or

```
\{\{\langle family\rangle\}\{\langle series\rangle\}\{\langle shape\rangle\}\}
```

\version@list We initialize the version list to be empty.

- 16 \let\version@list=\@empty
- 17 \@onlypreamble\version@list

\version@elt

- 18 \let\version@elt\relax
- 19 \@onlypreamble\version@elt

\new@mathversion The macro \new@mathversion is called with the version control sequence as its argument.

20 %\def\new@mathversion#1{%

The first thing this macro does is to check if the version identifier is already present in \version@list. We enclose \version@list in braces since it might be empty (if no version is defined yet). But this means that we need a suitable number of \expandafter primitives.

- 21 % \expandafter\in@\expandafter#1\expandafter{\version@list}%
- 22 % \ifin@

If so it prints an error message. The \next macro is used to get rid of the four characters \mv@ that would otherwise appear at the begin of the version name in the error message.

```
23 %
       \@latex@error{Math version
24 %
                   '\expandafter\@gobblefour\string#1'
                   already defined}\@eha
25 %
```

Otherwise we have a new version, and we can proceed with entering it into the tables. We add it to \version@list. This is very easy: we define \version@elt (which is the delimiter in \version@list) to protect itself and the following token from being expanded and simply redefine \version@list.

```
26 %
     \else
27 %
         \global\expandafter\newcount\csname c@\expandafter
28 %
                                      \@gobble\string#1\endcsname
29 %
         \global\csname c@\expandafter
                                      \verb|\gobble\string#1\endcsname\@ne|
30 %
31 %
         \def\version@elt{\noexpand\version@elt\noexpand}%
32 %
         \edef\version@list{\version@list\version@elt#1}%
```

Then we prepare to enter the new version into all math alphabet identifier lists. Remember that these lists use \reserved@c as delimiter, and that there appears the control sequence \reserved@e that must not be expanded. Therefore we take suitable precautions.

```
33 %
        \def\reserved@c{\noexpand\reserved@c\noexpand}%
```

```
34 %
         \let\reserved@e\relax
```

We will now go through the \alpha@list to process every \( \alpha alpha bet \) identifier) in turn. Since this list has \group@elt as a delimiter we define this control sequence. It has three arguments as every entry consists of three items (as explained above).

```
35 %
        \def\group@elt##1##2##3{%
```

The first of these arguments is the  $\langle math \ alphabet \ identifier \rangle$ . We redefine it by appending the information about the new version at the end of the list contained in it. However, there is one subtlety: the definitions for \reserved@c and \reserved@e made above prevent the main part of the list from being expanded. But we still have to take care of the header and the trailer. To do this we remove the trailer by means of the macro \remove@nil which also protect the header from being expanded. Its definition is given below. Now we can prepare to add the new version.

```
36 %
              \edef##1{\expandafter\remove@nil##1%
37 %
                        \reserved@c
38 %
                        #1%
                        \reserved@e
39 %
40 %
                        \noexpand\@nil}}%
```

Finally we call \alpha@list which will now execute the macro \group@elt once for every defined  $\langle math \ alphabet \ identifier \rangle$ . And that's all for now.

```
41 %
         \alpha@list
42 %
     \fi}
```

\alpha@list As we explained above every entry in \alpha@list has the form

#### \alpha@elt

 $\langle alphabet\ identifier \rangle \langle internal\ group\ number \rangle \langle default\ font\ assignments \rangle \dots$ 

We initialize it to \@empty.

- $43 \left( \frac{3}{1}\right)$
- 44 \@onlypreamble\alpha@list

#### \alpha@elt

- 45 \let\alpha@elt\relax
- 46 \@onlypreamble\alpha@elt

\newgroup Start the group (fam) allocation at 0. (Doesn't belong here.)

47 \count18=-1

\stepcounter

\select@group

We surround \select@group with braces so that functions using it can be used directly after \_ or ^. However, if we use oldstyle syntax where the math alphabet doesn't have arguments (ie if \math@bgroup is not \bgroup) we need to get rid of the extra group.

                          This macro checks if the second arg is a "math type" such as \mathopen. The
\@xxDeclareMathDelimiter
                           undocumented original code didn't use math types when the delimiter was a sin-
                           gle letter. For this reason the coding is a bit strange as it tries to support the
                           undocumented syntax for compatibility reasons.
                           685 \def\@xxDeclareMathDelimiter#1#2#3#4{%
                           7 is the default value returned in the case that \mathchar@type is passed some-
                           thing unexpected, like a math symbol font name. We locally move \mathalpha
                           out of the way so if you use that the right branch is taken. This will still fail if an
                           explicit number 7 is used!
                           686
                                 \begingroup

```

File r: ltfssdcl.dtx Date: 2016/02/18 Version v3.0r

\expandafter\@firstofone

691

\else

If this branch is taken we have old syntax (5 arguments).

If this branch is taken \mathchar@type is different from 7 so we assume new syntax. In this case we also use the arguments to set up the letter as a math symbol for the case where it is not used as a delimiter.

```
692 \endgroup
693 \DeclareMathSymbol#1{#2}{#3}{#4}%
```

Then we arrange that \@xDeclareMathDelimiter only gets #1, #3, #4 ... as it does not expect a math type as argument.

```

\DeclareSymbolFontAlphabet@
                               872 \def\DeclareSymbolFontAlphabet@#1#2#3{%
```

File r: ltfssdcl.dtx Date: 2016/02/18 Version v3.0r

We use the switch \if@tempswa to decide if we can declare this symbol font alphabet.

```
873
       \@tempswatrue
First check if #2 is known to be a symbol font
     \expandafter\in@\csname sym#2\expandafter\endcsname
874
        \expandafter{\group@list}%
875
     \ifin@
876
Check if #1 is defined as a math alphabet defined via \DeclareMathAlphabet:
       \expandafter\in@\expandafter#1\expandafter{\alpha@list}%
877
       \ifin@
878
If so remove it from the \alpha@list and from all math version macros.
         \OfontOinfo{Redeclaring math alphabet \string#3}%
879
880
         881
         \def\alpha@elt##1##2##3{%
             882
883
         \alpha@list
         \xdef\alpha@list{\theta\to 0}
884
Now we loop over all versions and remove the math alphabet:
         \def\version@elt##1{%
885
             \begingroup
886
               \t 0
887
               \def\getanddefine@fonts###1###2{%
888
                  \addto@hook\toks@{\getanddefine@fonts####1###2}}%
889
               \def\install@mathalphabet###1###2{%
890
891
                  \ifx####1#1\else
892
                    \addto@hook\toks@{\install@mathalphabet
893
                                      ####1{####2}}\fi}%
               ##1%
894
               895
             \endgroup
896
            ጉ%
897
         \version@list
898
899
If #3 is not defined as a math alphabet check if it is defined at all:
900
         \expandafter\ifx
         \csname\expandafter\@gobble\string#1\space\endcsname
901
902
         \relax
If it is undefined, fine otherwise check if it is a math alphabet defined via
\DeclareSymbolFontAlphabet:
         \else
903
           \edef\reserved@a{%
904
905
             \noexpand\in@{\string\use@mathgroup}{\meaning#1}}%
906
           \reserved@a
           \ifin@
907
             \OfontOinfo{Redeclaring math alphabet \string#3}%
908
```

Since the command #3 is defined to be something which is not a math alphabet we have to skip redefining it.

910 \@tempswafalse

```
911 \@latex@error{Command '\string#3' already defined}\@eha

912 \fi

913 \fi

914 \fi

915 \else
```

Since the symbol font is not known we better skip defining this alphabet.

```
916 \Centsum \( \text{Qtempswafalse} \)
917 \Centsum \( \text{Qtempswafalse} \)
918 \fi
919 \iff \( \text{Qtempswa} \)
```

When we reach this point we are allowed to define #1 to be a symbol font math alphabet. This means that we have to set it to

The  $\langle math\text{-}settings \rangle$  are the one for the encoding that is used in the font shape where  $\langle \text{sym} \langle name \rangle$  is pointing to. This means that we have to get it from the information stored in  $\langle \text{group@list}$ . Thus we loop through that list after defining  $\langle \text{group@elt}$  in a suitable way.

```
\def\group@elt##1##2{%
920
921
           \expandafter\ifx\csname sym#2\endcsname##1%
922
           \expandafter\reserved@a\string##2\@nil
923
           fi}%
924
        \def\reserved@a##1##2/##3\@nil{%
925
           \def\reserved@a{##2}}%
        \group@list
926
        \toks@{\relax\ifmmode \else \non@alpherr#1\fi}%
927
        \edef#1{\the\toks@
928
929
                 \noexpand\use@mathgroup
                 \expandafter\noexpand\csname M@\reserved@a\endcsname
930
931
                 \csname sym#2\endcsname}%
932
        \def#3{\protect#1}%
933
      \fi
934 }
935 \verb|\doc| are Symbol Font Alphabet @
936 (/2ekernel)
```

#### File s

# ltfssini.dtx

This file contains the top level LATEX interface to the font selection scheme commands. See other parts of the LATEX distribution, or The LATEX Companion for higher level documentation of these commands.

#### NFSS Initialisation 35

Finally, there are six commands that are to be used in IATEX and that we will therefore protect against expansion at the wrong point: \fontfamily, \fontseries, \fontshape, \fontsize, \selectfont, and \mathversion.

```
1 (*2ekernel)
```

#### Providing math versions 35.1

LATEX provides two versions. We call them normal and bold, respectively.

- 2 \DeclareMathVersion{normal}
- 3 \DeclareMathVersion{bold}

Now we define the standard font change commands. We don't allow the use of \rmfamily etc. in math mode.

First the changes to another family:

```
4 \DeclareRobustCommand\rmfamily
          {\not@math@alphabet\rmfamily\mathrm
           \fontfamily\rmdefault\selectfont}
7 \DeclareRobustCommand\sffamily
8
          {\not@math@alphabet\sffamily\mathsf
9
           \fontfamily\sfdefault\selectfont}
10 \DeclareRobustCommand\ttfamily
          {\not@math@alphabet\ttfamily\mathtt
11
           \fontfamily\ttdefault\selectfont}
```

Then the commands changing the *series*:

```
13 \DeclareRobustCommand\bfseries
          {\not@math@alphabet\bfseries\mathbf
14
           \fontseries\bfdefault\selectfont}
15
16 \DeclareRobustCommand\mdseries
          {\not@math@alphabet\mdseries\relax
17
           \fontseries\mddefault\selectfont}
18
19 \DeclareRobustCommand\upshape
          {\not@math@alphabet\upshape\relax
20
           \fontshape\updefault\selectfont}
```

Then the commands changing the *shape*:

```
22 \DeclareRobustCommand\slshape
          {\not@math@alphabet\slshape\relax
23
24
           \fontshape\sldefault\selectfont}
25 \DeclareRobustCommand\scshape
          {\not@math@alphabet\scshape\relax
26
27
           \fontshape\scdefault\selectfont}
```

```
28 \DeclareRobustCommand\itshape
29 {\not@math@alphabet\itshape\mathit
30 \fontshape\itdefault\selectfont}
```

\eminnershape

We also have to define the *emphasize* font change command (i.e. \em). This command will look is the current font is sloped (i.e. has a positive \fontdimen1) and will then select either \upshape or \itshape.

```
31 (/2ekernel)
32 \ \langle latexrelease \rangle \backslash IncludeInRelease \{2015/01/01\} \{\eminnershape\} \{\eminnershape\} \} 
33 (*2ekernel | latexrelease)
34 \DeclareRobustCommand\em
            {\@nomath\em \ifdim \fontdimen\@ne\font >\z@
35
                              \eminnershape \else \itshape \fi}%
36
37 \def\eminnershape{\upshape}%
38 (/2ekernel | latexrelease)
39 (latexrelease)\EndIncludeInRelease
40 \ \langle latexrelease \rangle \backslash IncludeInRelease \{0000/00/00\} \{\ell\} \} \\
41 (latexrelease)\DeclareRobustCommand\em
42 (latexrelease)
                        {\@nomath\em \ifdim \fontdimen\@ne\font >\z@
43 (latexrelease)
                                           \upshape \else \itshape \fi}%
44 (latexrelease)\let\eminnershape\@undefined
45 (latexrelease)\EndIncludeInRelease
46 (*2ekernel)
```

\not@math@alphabet

This function generates an error message when it is called in math mode. The same function should be defined in newlfont.sty.

```
47 \def\not@math@alphabet#1#2{%
48
     \relax
49
     \ifmmode
       \@latex@error{Command \noexpand#1invalid in math mode}%
50
           {%
51
           Please
52
            \int x#2\relax
53
               define a new math alphabet^^J%
54
55
               if you want to use a special font in math mode%
```

We have to a \noexpand below to prevent expansion of #2. In case of #1 we can omit this (due to the current definition of robust commands since they do come out right there:-).

Finally we provide two abbreviations to switch to the LATEX versions.

```
63 \def\boldmath{\@nomath\boldmath}
64 \mathversion{bold}}
65 \def\unboldmath{\@nomath\unboldmath}
66 \mathversion{normal}}
```

Here we switch to the default math version by defining the internal macro \math@version. We dare not to call \mathversion at this place because this would call \glb@settings.

67 \def\math@version{normal}

### 35.2 Miscellaneous

\newfont \symbol

We start by defining a few macros that are part of standard LaTeX's user interface. The use of these functions is not encouraged, but they will allow to process older documents without changes to the source.

- 68 \def\newfont#1#2{\@ifdefinable#1{\font#1=#2\relax}}
- 69 \def\symbol#1{\char #1\relax}

\@setfontsize \@setsize This abbreviation is used by LATEX's user level size changing commands, such as \large.

70 \def\@setfontsize#1#2#3{\@nomath#1%

For the benefit of people relying on keeping the name of the current font command saved in \@currsize we define it. To ensure that \@setfontsize keeps being robust we omit this assignment during times where \protect differs from \@typeset@protect.

- 71 \ifx\protect\@typeset@protect
- 72 \let\@currsize#1%
- 73 \fi
- 74 \fontsize{#2}{#3}\selectfont}

For compatibility we also define \@setsize the 209 command

- 75  $\langle *compat \rangle$
- 76 \def\@setsize#1#2#3#4{\@setfontsize#1{#4}{#2}}
- 77 (/compat)

\oldstylenums

This macro implements old style numerals but only works if we assume that the standard math fonts are used. Thus it needs changing in case other math encodings are used.

- 78 \def\oldstylenums#1{%
- 79 \begingroup

Provide spacing using the interword space of the current font.

80 \spaceskip\fontdimen\tw@\font

Then switch to the math italic font. We don't change the current value of \f@series which means that you can use bold numerals if \bfseries is in force. As family we use \rmdefault which means that this only works if there exist an OML encoded version of that font or rather a corresponding .fd file (which is the case for standard LATEX fonts even though they only contain substitutions).

- 81 \usefont{OML}{\rmdefault}{\f@series}{it}%
- 82 \mathgroup\symletters #1%
- 83 \endgroup
- 84 }

\hexnumber@

To set up LATEX's special math character definitions we first provide a macro to generate hexadecimal numbers. It is a rather simple \ifcase.

85 \def\hexnumber@#1{\ifcase\number#1

File s: ltfssini.dtx Date: 2016/10/15 Version v3.1b

```
86 O\or 1\or 2\or 3\or 4\or 5\or 6\or 7\or 8\or 87 9\or A\or B\or C\or D\or E\or F\fi}
```

\nfss@text

In it simplest form \nfss@text is an \mbox. This will produce unbreakable text outside math and inside math you will get text with the same fonts as outside. The only drawback is that such item won't change sizes in subscripts. But this behavior can be easily changed. With the amstex style option one will get a sub style called amstext which will redefine the \nfss@text macro to produce correct text in all sizes.

We have to use \def instead of the shorter \let since \mbox is undefined when we reach this point.

```
88 \def\nfss@text#1{{\mbox{#1}}}
```

\copyright

The definition of \copyright was changed so that it works in other type styles, and to make it robust. We leave the family untouched so that the copyright notice will come out differently if a different font family is in use. This command is commented out, since it is now defined in ltoutenc.dtx.

```
89 %\DeclareRobustCommand\copyright
90 % {{\ooalign{\hfil}
91 % \raise.07ex\hbox{\mdseries\upshape c}\hfil\crcr
92 % \mathhexbox20D}}}
```

\normalfont
\reset@font
\p@reset@font

The macro \reset@font is used in IATEX to switch to a standard font, in order to initialize the current font in situations where typesetting is done in a new visual context (e.g. in a footnote). We define it here to allow the test for the new IATEX version above but nevertheless are able to run all kind of mixtures.

The user interface name for \reset@font is \normalfont:

```
93 \DeclareRobustCommand\normalfont
94 {\usefont\encodingdefault
95 \familydefault
96 \seriesdefault
97 \shapedefault
98 \relax}
99 \let\reset@font\normalfont
```

We left out the special LaTeX fonts which are not automatically included in the base version of the font selection since these fonts contain only a few characters which are also included in the AMS fonts so anybody who is using these fonts doesn't need them. But for compatibility reasons we will define these symbols.

```
100 \def\not@base#1{\@latex@error
101 {Command \noexpand#1not provided in base LaTeX2e}%
102 {Load the latexsym or the amsfonts package to
103 define this symbol}}
104 \def\mho{\not@base\mho}
105 \def\Join{\not@base\Join}
106 \def\Box{\not@base\Box}
107 \def\Diamond{\not@base\Diamond}
108 \def\leadsto{\not@base\leadsto}
109 \def\sqsubset{\not@base\sqsubset}
110 \def\lad{\not@base\lhd}
```

```
112 \def\unlhd{\not@base\unlhd}
113 \def\rhd{\not@base\rhd}
114 \def\unrhd{\not@base\unrhd}
```

We now initialize all variables set by \DeclareErrorFont. These values are not really important since they will be overwritten later on by the definition in fontdef.ltx.

However, if fontdef.cfg is corrupted then at least a hopefully suitable error font is present.

We now load the customizable parts of NFSS.

Ditto for math although I don't think that we will get a lot of customisation :-)

Then we preload several fonts. This file might be customized without changing the behavior of the format (i.e. necessary font definitions will be loaded at runtime if they are not preloaded). This is done in the file preload.ltx.

\@acci We also save the values of some accents in \@acci, \@accii and \@acciii so they \@accii can be restored by a minipage inside a tabbing environment.
\@acciii 148 \let\@accii, \let\@acciii\=

\cal Here were the two old  $\langle alphabet\ identifiers \rangle$ . \mit  $_{149} \ \langle /2 ekernel \rangle$ 

#### File t

# fontdef.dtx

## 36 Introduction

This file is used to generate the files fonttext.ltx (text font declarations) and fontmath.ltx (math font declarations), which are used during the format generation. It contains the declaration of the standard text encodings used at the site as well as a minimal subset of font shape groups that NFSS will look at to ensure that the specified encodings are valid.

The math part contains the setup for math encodings as well as the default math symbol declarations that belong to the encoding.

It is possible to change this setup (by using other fonts, or defaults) without losing the ability to process documents written at other sites. Portability in this sense means that a document will compile without errors. It does not mean, however, that identical output will be produced. For this it is necessary that the distributed setup is used at both installations.

# 37 Customization

You are not allowed to change this source file! If you want to change the default encodings and/or the font shape groups preloaded you should should create a copy of fonttext.ltx under the name fonttext.cfg and change this copy. If LATEX  $2\varepsilon$  finds a file of this name it will use it, otherwise it uses the standard file which is fontdef.ltx.

If you don't plan to use Computer Modern much or at all, it might (!) be a good idea to make your own fonttext.cfg. Look at the comments below (docstrip module 'text') to see what should should go into such a file.

To change the math font setup use a copy of fontmath.ltx under the name fontmath.cfg and change this copy. However, dealing with this interface is even more a job for an expert than changing the text font setup — in short, we don't encourage either.

Warning: please note that we don't support customised IATEX versions. Thus, before sending in a bug report please try your test file with a IATEX format which is not customised and send in the log from that version (unless the problem goes away).

Please note: the following standard encodings have to be defined in all local variants of font....cfg to guarantee that all LaTeX installations behave in the same way.

 $\begin{array}{ll} \text{T1} & \text{Cork TEX text encoding} \\ \text{OT1} & \text{old TEX text encoding} \end{array}$ 

U unknown encoding

 $\begin{array}{ll} \mbox{OML} & \mbox{old} \ \mbox{TEX} \ \mbox{math letters encoding} \\ \mbox{OMS} & \mbox{old} \ \mbox{TEX} \ \mbox{math symbols encoding} \\ \end{array}$ 

OMX old T<sub>E</sub>X math extension symbols encoding

TU Unicode

File t: fontdef.dtx Date: 2016/12/03 Version v3.0a

Notice that some of these encodings are 'old' in the sense that we hope that they will be superseded soon by encoding standards defined by the TeX user community. Therefore this set of default encodings may change in the future.

The first candidate is OT1 which will soon be replaced by T1, the official TEX text encoding.

Warning: If you add additional encodings to this file there is no guarantee any longer that files processable at your installation will also be processable at other installations. Thus, if you make use of such an encoding in your document, e.g. if you intend to typeset in Cyrillic (OT2 encoding), you need to specify this encoding in the preamble of your document prior to sending it to another installation. Once the encoding is specified in that place in your document, the document is processable at all LATEX installations (provided they have suitable fonts installed).

For this reason we suggest that you define a short package file that sets up an additional encoding used at your site (rather than putting the encoding into this file) since this package can easily be shipped with your document.

# 38 The docstrip modules

The following modules are used to direct docstrip in generating external files:

```
driver produce a documentation driver file text produce the file fonttext.ltx math produce the file fontmath.ltx cfgtext produce a dummy fonttext.cfg file cfgmath produce a dummy fontmath.cfg file
```

A typical docstrip command file would then have entries like:

\generateFile{fonttext.ltx}{t}{\from{fontdef.dtx}{text}}

### 39 A driver for this document

The next bit of code contains the documentation driver file for T<sub>E</sub>X, i.e. the file that will produce the documentation you are currently reading. It will be extracted from this file by the DOCSTRIP program.

```
1 (*driver)
2 \documentclass{ltxdoc}
3 \GetFileInfo{fontdef.dtx}
4 \begin{document}
5 \DocInput{fontdef.dtx}
6 \end{document}
7 (/driver)
```

#### 40 The fonttext.ltx file

The identification is done earlier on with a \ProvidesFile declaration.

```
8 (*text)
9 \typeout{=== Don't modify this file, use a .cfg file instead ===^^J}
```

#### 40.1 **Encodings**

This file declares the standard encodings for text and math fonts. All others should be declared in packages or in the documents directly.

For every text encoding there are normally a number of encoding specific commands, e.g. accents, special characters, etc. (The definition for such a command might have to change when the encoding is changed, because the character is in a different position, or not available at all, or the accent is produced in a different way.) This is handled by a general mechanism which is described in ltoutenc.dtx.

By convention, text encoding specific declarations, including the declaration \DeclareFontEncoding, are kept in separate file of the form  $\langle enc \rangle$ enc.def, e.g. otlenc.def. This allows other applications to make use of the declarations as well.

Similar to the default encoding, the loading of the encoding files for the two major text encodings shouldn't be changed. In particular, the inputenc package depends on this.

```
10 \input {omlenc.def}
11 \input {t1enc.def}
12 \input {ot1enc.def}
                             % <- should come after T1 for speed
13 \input {omsenc.def}
```

14 \ifx\Umathchar\@undefined

We then set set the default text font encoding. This will hopefully change some day to T1. This setting should *not* be changed to produce a portable format.

```
15 \fontencoding{OT1}
      16 \else
Unicode.
      17 \input {tuenc.def}
      18 \fontencoding{TU}
      19 \DeclareFontSubstitution{TU}{lmr}{m}{n}
      20 \begingroup
     21 \nsspace{21 \
     22 \input {tulmr.fd}
     23 \input {tulmss.fd}
     24 \input {tulmtt.fd}
     25 \endgroup
      26 \DeclareFontSubstitution{TU}{lmr}{m}{n}
End of Unicode branch.
```

If different encodings for text fonts are in use one could put the common setup into \DeclareFontEncodingDefaults. There is now a better mechanism so using this interface is discouraged!

28 \DeclareFontEncodingDefaults{}{}

Then we define the default substitution for every encoding. This release of  $\LaTeX$   $\mathbb{R}^2$  assumes that the ec fonts are available. It is possible to change this to point to some other font family (e.g., Times with the appropriate encoding if it is available) without making documents non-portable. However, in such a case documents will produce different page breaks at other sites. The substitution defaults can all be changed without losing portability as long as there are font shape definitions for the selected substitutions.

```
29 \DeclareFontSubstitution{T1}{cmr}{m}{n}
30 \DeclareFontSubstitution{OT1}{cmr}{m}{n}
```

For every encoding declaration, LaTeX  $2_{\varepsilon}$  will try to verify that the given substitution information makes sense, i.e. that it is impossible to go into an endless loop if font substitution happens. This is done at the moment the \begin{document} begin{document} is encountered. LaTeX  $2_{\varepsilon}$  will then check that for every encoding the substitution defaults form a valid font shape group, which means that it will check if there is a \DeclareFontShape declaration for this combination. We will therefore load the corresponding .fd files now. If we don't do this they would be loaded at verification time (i.e. at \begin{document} begin{document} beg

Warning: Please note that this means that you have to regenerate the format whenever you change any of these .fd files since LaTeX  $2\varepsilon$  will not read .fd files if it already knows about the encoding/family combination.

The \nfss@catcodes ensures that white space is ignored in any definitions made in the fd files.

```
31 \begingroup
32 \nfss@catcodes
33 \input {t1cmr.fd}
34 \input {ot1cmr.fd}
35 \endgroup
```

We also load some other font definition files which are normally needed in a document. This is only done for processing speed and you can comment the next two lines out to save some memory. If necessary these files are then loaded when your document is processed. (Loading .fd files is a less drastic step compared to preloading fonts because the number of fonts is limited 255 at (nearly) every TeX installation, while the amount of main memory is not a limiting factor at most installations.)

```
36 \begingroup
37 \nfss@catcodes
38 \input {ot1cmts.fd}
39 \input {ot1cmtt.fd}
40 \endgroup
```

Even with all the precautions it is still possible that NFSS will run into problems, for example, when a .fd file contains corrupted data. To guard against such cases NFSS has a very low-level fallback font that is installed with the following line.

### 41 $\DeclareErrorFont{OT1}{cmr}{m}{n}{10}$

This means, "if everything else fails use Computer Modern Roman normal shape at 10pt in the old text encoding". You can change the font used but the encoding should be the same as the one specified with \fontencoding above.

#### 40.2 Defaults

To allow the use of \rmfamily, \sffamily, etc. in documents even if non-standard families are used we provide nine macros which hold the name of the corresponding families, series, and so on. This makes it easy to use other font families (like Times Roman, etc.). One simply has to redefine these defaults.

All these hooks have to be defined in this file but you can change their meaning (except for \encodingdefault) without making documents non-portable.

```
The following three definitions set up the meaning for \rmfamily, \sffamily, and
\encodingdefault
      \rmdefault
                    \ttfamily.
      \sfdefault
                     42 (/text)
      \ttdefault
                    43 (*text | latexrelease)
                     44 \ifx\Umathchar\@undefined
                     45 \newcommand\encodingdefault{OT1}
                     46 \newcommand\rmdefault{cmr}
                     47 \newcommand\sfdefault{cmss}
                     48 \newcommand\ttdefault{cmtt}
                     49 \else
                     50 \newcommand\encodingdefault{TU}
                     51 \newcommand\rmdefault{lmr}\fontfamily{\rmdefault}
                     52 \newcommand\sfdefault{lmss}
                     53 \newcommand\ttdefault{lmtt}
                     54 \fi
                     55 (latexrelease)\IncludeInRelease{2017/01/01}%
                     56 (latexrelease)
                                                       {\encodingdefault}{TU encoding default}%
                     57 (latexrelease) \ifx\Umathchar\@undefined
                     58 \ \langle \texttt{latexrelease} \rangle \\ \texttt{`renewcommand} \\ \texttt{`encodingdefault{OT1}}
                     59 (latexrelease) \renewcommand \rmdefault {cmr}
                     60 (latexrelease)\renewcommand\sfdefault{cmss}
                     61 (latexrelease)\renewcommand\ttdefault{cmtt}
                     62 (latexrelease)\else
                     63 (latexrelease)\renewcommand\encodingdefault{TU}
                     64 (latexrelease)\renewcommand\rmdefault{lmr}
                     65 (latexrelease)\renewcommand\sfdefault{lmss}
                     66 (latexrelease)\renewcommand\ttdefault{lmtt}
                     67 (latexrelease)\fi
                     68 (latexrelease) \EndIncludeInRelease
                     69 (latexrelease) \IncludeInRelease \{0000/00/00\}%
                     70 (latexrelease)
                                                       {\encodingdefault}{TU encoding default}%
                     71 (latexrelease)\renewcommand\encodingdefault{OT1}
                     72 (latexrelease)\renewcommand\rmdefault{cmr}
                     73 (latexrelease)\renewcommand\sfdefault{cmss}
                     74 (latexrelease) \renewcommand \ttdefault{cmtt}
                     75 (/text | latexrelease)
                     76 (*text)
      \bfdefault
                    Series changing commands are influenced by the following hooks.
      \mddefault
                     77 \newcommand\bfdefault{bx}
                     78 \newcommand\mddefault{m}
      \itdefault Shape changing commands use the following hooks.
      \sldefault
                     79 \mbox{ } \mbox{newcommand\ } \mbox{itdefault{it}}
      \scdefault
                     80 \newcommand\sldefault{sl}
      \updefault
```

```
81 \newcommand\scdefault{sc}
82 \newcommand\updefault{n}
```

\familydefault \seriesdefault \shapedefault Finally we have the hooks that describe the behaviour of the \normalfont command. To stay portable, the definition of \encodingdefault should not be changed and should match the setting above for \fontencoding. All other values can be set according to your taste.

```
83 \newcommand\familydefault{\rmdefault}
84 \newcommand\seriesdefault{\rmdefault}
85 \newcommand\shapedefault{\updefault}

This finishes the low-level setup in fonttext.ltx.
86 \( \seta / \text \rangle \)
```

## 41 The fontmath.ltx file

The identification is done earlier on with a \ProvidesFile declaration.

```
87\ \langle ^*math \rangle 88\ typeout{=== Don't modify this file, use a .cfg file instead ===^^J}
```

## 41.1 The font encodings used

```
89 \DeclareFontEncoding{OML}{}{}
90 \DeclareFontEncoding{OMS}{}{}
91 \DeclareFontEncoding{OMX}{}{}
```

Finally a declaration for U encoding which serves for all fonts that do not fit standard encodings. For math this sets up \noaccents@ providing for AMS-ETEX. This macro is used therein to handle accented characters if they are not supported by the font. In other words, if fonts with U encoding are used in math, all accents (like from \breve) are obtained from some other font that has them.

92 \DeclareFontEncoding{U}{}\noaccents@}

```
The encodings for math are next:
```

```
93 \DeclareFontSubstitution{OML}{cmm}{m}{it}
94 \DeclareFontSubstitution{OMS}{cmsy}{m}{n}
95 \DeclareFontSubstitution{OMX}{cmex}{m}{n}
96 \DeclareFontSubstitution{U}{cmr}{m}{n}
97 \begingroup
98 \nfss@catcodes
99 \input {omlcmm.fd}
100 \input {omscmsy.fd}
101 \input {omxcmex.fd}
102 \input {ucmr.fd}
103 \endgroup
```

#### 41.1.1 Symbolfont and Alphabet declarations

We now define the basic symbol fonts used by LATEX. These four symbol fonts must be defined by this file.

It is possible to make the symbol fonts point to other external fonts without losing the ability to process documents written at other sites, as long as one defines the same symbol font names with the same encodings, e.g. operators with OT1

etc. If other encodings are used documents become non-portable. Such a change should therefore be done in a package file.

Below are the seven math alphabets which are defined by NFSS. Again they must be defined by this file. However, as before you can change the fonts used without losing portability, but you should be careful when changing the encoding since that may make documents come out wrong.

Given the currently available fonts we cannot bold-en \mathbf and \mathtt but in principle one could use 'ultra bold' or something. The alphabets defined via \DeclareSymbolFontAlphabet will change automatically in a new math version if the corresponding symbol font changes.

```
118 \SetMathAlphabet\mathsf{bold}{OT1}{cmss}{bx}{n}
119 \SetMathAlphabet\mathit{bold}{OT1}{cmr}{bx}{it}
```

#### 41.2 Math font sizes

The declarations below declare the text, script and scriptscript size to be used for each text font size.

All occurrences of sizes longer than a single character are replaced with the macro name that holds them, saving a number of tokens (but losing a bit of speed, so this may not stay this way).

```
120 \DeclareMathSizes{5}{5}{5}\{5}\{5}\{121} \DeclareMathSizes{6}{6}{5}{5}\{5}\{122} \DeclareMathSizes{7}{7}{5}{5}\{5}\{123} \DeclareMathSizes{8}{8}{6}{5}\{5}\{124} \DeclareMathSizes{8}{8}{6}{5}\{5}\{125} \DeclareMathSizes{9}{9}{6}{5}\{5}\{126} \DeclareMathSizes{\@xpt}{\@xpt}{7}{5}\{126} \DeclareMathSizes{\@xipt}{\@xipt}{8}{6}\{127} \DeclareMathSizes{\@xipt}{\@xipt}{8}{6}\{128} \DeclareMathSizes{\@xipt}{\@xipt}{\@xipt}{7}\{129} \DeclareMathSizes{\@xipt}{\@xvipt}{\@xvipt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}}{\@xxpt}{\@xxpt}{\@xxpt}}{\@xxpt}{\@xxpt}{\@xxpt}}{\@xxpt}{\@xxpt}{\@xxpt}}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt}{\@xxpt
```

### 41.3 The math symbol assignments

We start by setting up math codes for most of the characters typed in directly from the keyboard. Most of them are normally already setup up in the same way by IniTeX. However, we repeat them here to have a complete setup which can be exchanged with another if desired.

#### 41.3.1 The letters

```
132 \DeclareMathSymbol{a}{\mathalpha}{letters}{'a}
133 \DeclareMathSymbol{b}{\mathalpha}{letters}{'b}
134 \DeclareMathSymbol{c}{\mathalpha}{letters}{'c}
135 \DeclareMathSymbol{d}{\mathalpha}{letters}{'d}
136 \DeclareMathSymbol{e}{\mathalpha}{letters}{'e}
137 \DeclareMathSymbol{f}{\mathalpha}{letters}{'f}
138 \DeclareMathSymbol{g}{\mathalpha}{letters}{'g}
139 \DeclareMathSymbol{h}{\mathalpha}{letters}{'h}
140 \DeclareMathSymbol{i}{\mathalpha}{letters}{'i}
141 \DeclareMathSymbol{j}{\mathalpha}{letters}{'j}
142 \DeclareMathSymbol{k}{\mathalpha}{letters}{'k}
143 \DeclareMathSymbol{1}{\mathalpha}{letters}{'1}
144 \DeclareMathSymbol{m}{\mathalpha}{letters}{'m}
145 \DeclareMathSymbol{n}{\mathalpha}{letters}{'n}
146 \DeclareMathSymbol{o}{\mathalpha}{letters}{'o}
147 \DeclareMathSymbol{p}{\mathalpha}{letters}{'p}
148 \DeclareMathSymbol{q}{\mathalpha}{letters}{'q}
149 \DeclareMathSymbol{r}{\mathalpha}{letters}{'r}
150 \DeclareMathSymbol{s}{\mathalpha}{letters}{'s}
151 \DeclareMathSymbol{t}{\mathalpha}{letters}{'t}
152 \DeclareMathSymbol{u}{\mathalpha}{letters}{'u}
153 \DeclareMathSymbol{v}{\mathalpha}{letters}{'v}
154 \DeclareMathSymbol{w}{\mathalpha}{letters}{'w}
155 \DeclareMathSymbol{x}{\mathalpha}{letters}{'x}
156 \DeclareMathSymbol{y}{\mathalpha}{letters}{'y}
157 \DeclareMathSymbol{z}{\mathalpha}{letters}{'z}
158 \DeclareMathSymbol{A}{\mathalpha}{letters}{'A}
159 \DeclareMathSymbol{B}{\mathalpha}{letters}{'B}
160 \DeclareMathSymbol{C}{\mathalpha}{letters}{'C}
161 \DeclareMathSymbol{D}{\mathalpha}{letters}{'D}
162 \DeclareMathSymbol{E}{\mathalpha}{letters}{'E}
163 \DeclareMathSymbol{F}{\mathalpha}{letters}{'F}
164 \DeclareMathSymbol{G}{\mathalpha}{letters}{'G}
165 \DeclareMathSymbol{H}{\mathalpha}{letters}{'H}
166 \DeclareMathSymbol{I}{\mathalpha}{letters}{'I}
167 \DeclareMathSymbol{J}{\mathalpha}{letters}{'J}
168 \DeclareMathSymbol{K}{\mathalpha}{letters}{'K}
169 \DeclareMathSymbol{L}{\mathalpha}{letters}{'L}
170 \DeclareMathSymbol{M}{\mathalpha}{letters}{'M}
171 \DeclareMathSymbol{N}{\mathalpha}{letters}{'N}
173 \DeclareMathSymbol{P}{\mathalpha}{letters}{'P}
174 \DeclareMathSymbol{Q}{\mathalpha}{letters}{'Q}
175 \DeclareMathSymbol{R}{\mathalpha}{letters}{'R}
176 \DeclareMathSymbol{S}{\mathalpha}{letters}{'S}
177 \DeclareMathSymbol{T}{\mathalpha}{letters}{'T}
178 \DeclareMathSymbol{U}{\mathalpha}{letters}{'U}
179 \DeclareMathSymbol{V}{\mathalpha}{letters}{'V}
180 \DeclareMathSymbol{W}{\mathalpha}{letters}{'W}
```

```
181 \DeclareMathSymbol{X}{\mathalpha}{letters}{'X}
182 \DeclareMathSymbol{Y}{\mathalpha}{letters}{'Y}
183 \DeclareMathSymbol{Z}{\mathalpha}{letters}{'Z}
41.3.2 The digits
184 \DeclareMathSymbol{0}{\mathalpha}{operators}{'0}
185 \DeclareMathSymbol{1}{\mathalpha}{operators}{'1}
186 \DeclareMathSymbol{2}{\mathalpha}{operators}{'2}
187 \DeclareMathSymbol{3}{\mathalpha}{operators}{'3}
188 \DeclareMathSymbol{4}{\mathalpha}{operators}{'4}
189 \DeclareMathSymbol{5}{\mathalpha}{operators}{'5}
190 \end{figure} $$190 \end{fi
191 \ensuremath Symbol \ensuremath{7}{\mathbf{halpha}}{\mathbf{operators}}{\mathbf{'7}}
192 \DeclareMathSymbol{8}{\mathalpha}{operators}{'8}
193 \DeclareMathSymbol{9}{\mathalpha}{operators}{'9}
             Punctuation, brace, etc. keys
194 \DeclareMathSymbol{!}{\mathclose}{operators}{"21}
195 \DeclareMathSymbol{*}{\mathbin}{symbols}{"03} % \ast
196 \DeclareMathSymbol{+}{\mathbin}{operators}{"2B}
197 \DeclareMathSymbol{,}{\mathpunct}{letters}{"3B}
198 \DeclareMathSymbol{-}{\mathbin}{symbols}{"00}
199 \DeclareMathSymbol{.}{\mathord}{letters}{"3A}
200 \DeclareMathSymbol{:}{\mathrel}{operators}{"3A}
201 \DeclareMathSymbol{;}{\mathpunct}{operators}{"3B}
202 \DeclareMathSymbol{=}{\mathrel}{operators}{"3D}
203 \DeclareMathSymbol{?}{\mathclose}{operators}{"3F}
The following symbols are defined as delimiters below which automatically defines
them as math symbols.
204 %\DeclareMathSymbol{(){\mathopen}{operators}{"28}
205 %\DeclareMathSymbol{)}{\mathclose}{operators}{"29}
206 %\DeclareMathSymbol{/}{\mathord}{letters}{"3D}
207 %\DeclareMathSymbol{[]}{\mathopen}{operators}{"5B}
208 %\DeclareMathSymbol{]}{\mathclose}{operators}{"5D}
209 %\DeclareMathSymbol{|}{\mathord}{symbols}{"6A}
210 %\DeclareMathSymbol{<}{\mathrel}{letters}{"3C}
211 %\DeclareMathSymbol{>}{\mathrel}{letters}{"3E}
     Should all of the following being activated by default? Probably not.
212 \Delta \ DeclareMathSymbol{'\{}{\mathbb{}} \
213 %\DeclareMathSymbol{'\}}{\mathclose}{symbols}{"67}
214 %\DeclareMathSymbol{'\\}{\mathord}{symbols}{"6E} % \backslash
215 \mbox{ mathcode'} = "8000 % \mbox{ space}
216 \mathcode '\ '="8000 \% \ 'prime
217 \mathcode '\_="8000 % \_
41.3.4 Delimitercodes for characters
[to be completed]
     Finally, IniT<sub>E</sub>X sets all \delcode values to -1, except \delcode'.=0
218 \DeclareMathDelimiter{(}{\mathopen} {operators}{"28}{largesymbols}{"00}
219 \DeclareMathDelimiter{)}{\mathclose}{operators}{"29}{largesymbols}{"01}
220 \DeclareMathDelimiter{[]{\mathopen} {operators}{"5B}{largesymbols}{"02}
221 \DeclareMathDelimiter{]}{\mathclose}{operators}{"5D}{largesymbols}{"03}
```

The next two are considered to be relations when not used in the context of a delimiter! And worse, they do even represent different glyphs when being used as delimiter and not as delimiter. This is a user level syntax inherited from plain TeX. Therefore we explicitly redefine the math symbol definitions for these symbols afterwards.

```
\label{limiter} $$22 \operatorname{largesymbols}{"0A}$ $$23 \operatorname{largesymbols}{"0B}{224 \operatorname{largesymbols}{"0B}}$ $$24 \operatorname{largesymbols}{\normal}{\normal}{\normal}$ $$25 \operatorname{largesymbols}{\normal}{\normal}{\normal}{\normal}$ $$25 \operatorname{largesymbols}{\normal}{\normal}{\normal}$ $$25 \operatorname{largesymbols}{\normal}{\normal}{\normal}$ $$25 \operatorname{largesymbols}{\normal}{\normal}$ $$25 \operatorname{largesymbols}{\normal}{\normal}$ $$25 \operatorname{largesymbols}{\normal}{\normal}$ $$25 \operatorname{largesymbols}{\normal}{\normal}$ $$25 \operatorname{largesymbols}{\normal}{\normal}$ $$25 \operatorname{largesymbols}{\normal}{\normal}$ $$25 \operatorname{largesymbols}{\normal}{\normal}{\normal}$ $$25 \operatorname{largesymbols}{\normal}{\normal}$ $$25 \operatorname{largesymbols}{\normal}{\normal}$ $$25 \operatorname{largesymbols}{\normal}{\normal}$ $$25 \operatorname{largesymbols}{\normal}{\normal}$ $$25 \operatorname{largesymbols}{\normal}{\normal}$ $$25 \operatorname{largesymbols}{\normal}{\normal}{\normal}$ $$25 \operatorname{largesymbols}{\normal}{\normal}$ $$25 \operatorname{largesymbols}{\normal}{\normal}{\normal}$ $$25 \operatorname{largesymbols}{\normal}{\normal}$ $$25 \operatorname{largesymbols}{\normal}{\normal}{\normal}$ $$25 \operatorname{largesymbols}{\normal}{\normal}{\normal}$ $\normal}$ $$25 \operatorname{largesymbols}{\normal}{\normal}$ $\normal}$ $$25 \operatorname{largesymbols}{\normal}{\normal}$ $\normal}$ $$\normal}$ $$\normal
```

And here is another case where the non-delimiter version produces a glyph different from the delimiter version.

```
226 \DeclareMathDelimiter{/}{\mathord}{operators}{"2F}{largesymbols}{"0E}
227 \DeclareMathSymbol{/}{\mathord}{letters}{"3D}
228 \DeclareMathDelimiter{|}{\mathord}{symbols}{"6A}{largesymbols}{"0C}
229 \expandafter\DeclareMathDelimiter\@backslashchar
230 {\mathord}{symbols}{"6E}{largesymbols}{"0F}
```

N.B. { and } should NOT get delcodes; otherwise parameter grouping fails!

### 41.4 Symbols accessed via control sequences

#### 41.4.1 Greek letters

```
231 \DeclareMathSymbol{\alpha}{\mathord}{letters}{"OB}

```

In contrast to plain.tex \Relbar got braces around the equal sign to guard against it being "math active" expanding to \futurelet.... This might be the case when packages are implementing shorthands for math, e.g. => meaning \Rightarrow etc. It would actually be better not to use = in such definitions but instead define something like \mathequalsign and use this. However we can't do this now as it would break other math layouts where characters are in different places (since those wouldn't know about the need for a new command name).

\lgroup \rgroup \bracevert There are three plain TeX delimiters which are not fully supported by NFSS, since they partly point into a bold cmr font. Allocating a full symbol font, just to have three delimiters seems a bit too much given the limited space available. For this reason only the extensible sizes are supported. If this is not desired one can use, without losing portability, define \mathbf and \mathtt as font symbol alphabet (setting up cmr/bx/n and cmtt/m/n as symbol fonts first) and modify the delimiter declarations to point with their small variant to those symbol fonts. (This is done in oldlfont.dtx so look there for examples.)

## 41.6 Other special functions and parameters

### 41.6.1 Biggggg

```
568 \left\{ \frac{1{{\textstyle \n@space}}}{569 \det \left[\frac{1{\textstyle \n@space}}}{569 \det \left[\frac{1.\n@space}}}{570 \det \left[\frac{1.\n@space}}}{571 \det \left[\frac{1.\n@space}}}{571 \det \left[\frac{1.\n@space}}}{572 \det \left[\frac{1.\n@space}}{1.\n@space}}}
```

### 41.6.2 The log-like functions

\operator@font

The \operator@font determines the symbol font used for log-like functions.
573 \def\operator@font{\mathgroup\symoperators}

### 41.6.3 Parameters

```
574 \thinmuskip=3mu
575 \medmuskip=4mu plus 2mu minus 4mu
576 \thickmuskip=5mu plus 5mu
This finishes the low-level setup in fontmath.ltx.
577 \( /math \)
```

## 42 Default cfg files

We provide default cfg files here to ensure that on installations that search large file trees we do not pick up some strange customisation files from somewhere.

```
578 (*cfgtext | cfgmath | cfgprel)
579 %%
580 %%
581 %%
582 %% Load the standard setup:
585 (+cfgmath)\input{fontmath.ltx}
586 (+cfgprel)\input{preload.ltx}
587 %%
588 \% Small changes could go here; see documentation in cfgguide.tex for
589 %% allowed modifications.
590 %%
591 \% In particular it is not allowed to misuse this configuration file
592 %% to modify internal LaTeX commands!
594 %% If you use this file as the basis for configuration please change
595 %% the \ProvidesFile lines to clearly identify your modification, e.g.,
597 (+cfgtext) %% \ProvidesFile {fonttext.cfg} [2001/06/01
600 %%
                              Customised local font setup]
601 %%
602 %%
603 (/cfgtext | cfgmath | cfgprel)
```

### File u

# preload.dtx

## 43 Overview

This file contains an number of possible settings for preloading fonts during installation of NFSS2 (which is used by  $\LaTeX$  2 $\varepsilon$ ). It will be used to generate the following files:

minimal subset of fonts necessary to run NFSS2 preload.min preload.ori preload of CM fonts similar to the old lfonts.tex preload.ltx The standard selection of preloads cmpreloa.xpt preload of CM fonts for 10pt document size cmpreloa.xip preload of CM fonts for 11pt document size preload of CM fonts for 12pt document size cmpreloa.xii preload of DC fonts for 10pt size dcpreloa.xpt preload of DC fonts for 11pt size dcpreloa.xip dcpreloa.xii preload of DC fonts for 12pt size

These files are for installations that make use of Computer Modern fonts either old encoding (OT1) or Cork encoding (T1). The Computer Modern fonts with Cork encoding are known as DC-fonts.

Most important is preload.ltx which is used during format generation. You are *not* allowed to change this file.

## 44 Customization

You can customize the preloaded fonts in your LATEX  $2_{\varepsilon}$  system by installing a file with the name preload.cfg. If this file exists it will be used in place of the system file preload.ltx. You can, for example, copy one of the files mentioned above (that can be generated from this source) to preload.cfg.

Or you can define completely other preloads. In that case start from preload.min since that contains the fonts that have to be preloaded by \*all\*  $\LaTeX$  systems.

Avoid using preload.ori, it will load so many fonts that on most installations it is nearly impossible to load other font families afterwards. This file is only generated to show what fonts have been preloaded by LATEX 2.09.

If you normally use other fonts than Computer Modern preload.min might be best.

Warning: If you preload fonts with encodings other than the normally supported encodings you have to declare that encoding in a fontdef.cfg configuration file (see the documentation in the file fontdef.dtx). Adding an extra encoding to the format might produce non-portable documents, thus this should be avoided if possible.

#### Module switches for the DOCSTRIP program 45

The DOCSTRIP will generate the above file from this source using the following module directives:

```
driver
         produce a documentation driver file
preload
         produce a preload...file
         for OT1 encoded Computer Modern
cm
         for T1 encoded Computer Modern
dc
min
         produce minimal subset
         produce 10pt preloads
xpt
xipt
         produce 11pt preloads
         produce 12pt preloads
xiipt
         produce preloads similar to old lfonts.tex
ori
         produce preload.ltx
tex
```

A typical DOCSTRIP command file would then have entries like: \generateFile{preload.min}{t}{\from{preload.dtx}{preload,min}}

for generating preload files.

#### A driver for this document 46

The next bit of code contains the documentation driver file for T<sub>F</sub>X, i.e., the file that will produce the documentation you are currently reading. It will be extracted from this file by the DOCSTRIP program.

```
1 (*driver)
2 \documentclass{ltxdoc}
3 %\OnlyDescription % comment out for implementation details
4 \begin{document}
    \DocInput{preload.dtx}
6 \end{document}
7 (/driver)
```

#### The code 47

We begin by loading the math extension font (cmex10) and the LATEX line and circle fonts. It is necessary to do this explicitly since these are used by lplain.tex and latex.tex. Since the internal font name contains / characters and digits we construct the name via \csname. These are the only fonts (!) that must be loaded in this file.

All \DeclarePreloadSizes can be removed or others can be added, they only influence the processing speed.

```
8 \expandafter\font\csname OMX/cmex/m/n/10\endcsname=cmex10\relax
9 \font\tenln =line10
                        \font\tenlnw =linew10\relax
10 \font\tencirc=lcircle10 \font\tencircw=lcirclew10\relax
```

The above fonts should not be touched but anything below this point here in the preload suggestions can be modified without any problems.

```
11 \(\rightarrow\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\frac{1}{2}\)\(\

### File v

## ltfntcmd.dtx

#### Abstract

The commands defined in this file ltfntcmd are part of the kernel code for LaTeX  $2\varepsilon$  /NFSS2.

It is also meant to serve as documentation for package writers since it demonstrates how to define high-level font changing commands using a small number of creator functions.

## 48 Introduction

Font changes such as \bfseries, \sffamily, etc. are declarations; this means that their scope is delimited by the grouping structure, either by the next \end of some environment or by explicitly using a group, e.g., writing something like {\bfseries...} in the source. If you make the mistake of writing \bfseries{...} (thinking of \bfseries as a command with one argument) then the result is rather striking.

Font declarations are an artifact of the T<sub>E</sub>X system and for several reasons it is better to avoid them on the user level whenever possible. In L<sup>A</sup>T<sub>E</sub>X3 they will probably all be replaced by environments and by font commands taking one argument.

This file defines a creator function for such declarative font switches. This function creates commands which can be used in both math and text.

This file also defines a number of high-level commands (all starting with \text..) that have one argument and typeset this argument in the requested way. Thus these commands are for typesetting short pieces of text in a specific family, series or shape. These are all produced as examples of the use of a creator function which is itself also defined in this file.

Table 1 shows all these high-level commands in action. A further advantage of using these commands is that they automatically take care of any necessary italic correction on either side of their argument.

Thus, when using such commands, one does not have to worry about forgetting the italic correction when changing fonts. Only in very few situations is this additional space wrong but, for example, most typographers recommend omitting the italic correction if a small punctuation character, like a comma, directly follows the font change. Since the amount of correction required is partly a matter of taste, you can define in what situations the italic correction should be suppressed. This is done by putting the characters that should cancel a preceding italic correction in the list \nocorrlist.\footnote{\text{The default definition for this list is produced by the following.}

\newcommand \nocorrlist {,.}

248

File v: ltfntcmd.dtx Date: 2015/03/11 Version v3.4b

<sup>&</sup>lt;sup>7</sup>Any package that changes the \catcode of a character inside \nocorrlist must then explicitly reset the list. Otherwise the changed character will no longer be recognized by the suppression algorithm.

Command	Corresponds to	Action
	\rmfamily	Typeset argument in roman family
	\sffamily	Typeset argument in sans serif family
	$\texttt{\ttfamily}$	Typeset argument in typewriter family
	\mdseries	Typeset argument in medium series
	\bfseries	Typeset argument in <b>bold</b> series
	\upshape	Typeset argument in normal shape
	\itshape	Typeset argument in <i>italic</i> shape
	\slshape	Typeset argument in slanted shape
	\scshape	Typeset argument in SMALL CAPS shape
	\em	Typeset argument <i>emphasized</i>

Table 1: Font-change commands with arguments

The font change commands provided here all start with **\text..** to emphasize that they are for use in normal text and to be easily memorable. They automatically take care of any necessary italic correction on either side of the argument.

It is best to declare the most often used characters first, because this will make the processing slightly faster. For example,

```
\emph{When using the \NFSS{} high-level commands,
the \emph{proper} use of italic corrections is
automatically taken care of}. Only
\emph{sometimes} one has to help \LaTeX{} by
adding a \verb=\nocorr= command.
```

which results in:

When using the NFSS high-level commands, the proper use of italic corrections is automatically taken care of. Only sometimes one has to help IATEX by adding a \nocorr command.

In contrast, the use of the declaration forms is often more appropriate when you define your own commands or environments.

This gives:

• This environment produces boldface items.

# • It is defined in terms of LaTeX's itemize environment and NFSS declarations.

In addition to global customization of when to insert the italic correction, it is of course sometimes necessary to explicitly insert one with \/.

It is also possible to suppress the italic correction in individual instances. For this, the command \nocorr is provided.

The \nocorr must appear as the first or last token inside the braces of the argument of the \text... commands, at that end of the text where you wish to suppress the italic correction.

It is worth pointing out here that inserting a \/ in places where it can have no function (i.e. anywhere except immediately after a slanted letter) is not an error—it will just be silently ignored. Unfortunately this is not true if the redefinition of \/ in amstex.sty is used as this version can cause space to be removed immediately before the \/.

## 49 The implementation

\DeclareTextFontCommand

This is the creator function for **\text.**. commands. It gives a warning if **\foo** or **\fragfoo** is already defined.

In math mode it simply puts the font declaration and text into a box (possibly an automagically sized one).

Otherwise it first scans the text to see where \nocorr occurs within it. This sets the \check@ic commands to do what is necessary concerning the italic correction at both ends.

The algorithm for deciding whether to put in an italic correction is not very subtle: one is added whenever the newly current font is not itself positively sloped, unless the next token is a character in the 'nocorr' list. At the end of the text this is done after closing the group so as to check the 'outer font'. Note that this will often result in adding an italic correction token after a character in an unsloped font; we believe (in early 2003) that this is perhaps inefficient but not dangerous.

It also now checks for empty contents of the text command and optimises this case. Some care is also taken to check that doing dangerous things in vertical mode is avoided.

The italic correction token is added to the horizontal list before (in the list) an immediately preceding non-zero glob of glue (skip) and any non-zero penalty preceding that since, in the typical case, this puts it immediately after the last character in the preceding word.

Note that it is necessary to put in the \aftergroup\maybe@ic at the end of the group so that it comes after any other aftergroup tokens and immediately before the following tokens. It is also necessary to remove the \fi from the token list before the group ends; this is done by adding an \expandafter just before the closing brace.

```
1 (*2ekernel)
2 \def \DeclareTextFontCommand #1#2{%
3 \DeclareRobustCommand#1[1]{%
4 \ifmmode
5 \nfss@text{#2##1}%
6 \else
7 \hmode@bgroup
```

```
\text@command{##1}%
                  8
                           #2\check@icl ##1\check@icr
                 10
                           \expandafter
                 11
                          \egroup
                        \fi
                 12
                                            }%
                 13
                 14 }
       \textrm Now we define the \text\langle family \rangle commands in terms of the above; \textt does
       \textsf not look very nice!
       \texttt
                 15 \DeclareTextFontCommand{\textrm}{\rmfamily}
   \textnormal
                 16 \DeclareTextFontCommand{\textsf}{\sffamily}
                 17 \DeclareTextFontCommand{\texttt}{\ttfamily}
                 18 \DeclareTextFontCommand{\textnormal}{\normalfont}
       \textbf For the series attribute:
       \textmd
                 19 \DeclareTextFontCommand{\textbf}{\bfseries}
                 20 \DeclareTextFontCommand{\textmd}{\mdseries}
       \textit And for the shapes:
       \textsl
                 21 \DeclareTextFontCommand{\textit}{\itshape}
       \textsc
                 22 \DeclareTextFontCommand{\textsl}{\slshape}
       \textup
                 23 \DeclareTextFontCommand{\textsc}{\scshape}
                 24 \DeclareTextFontCommand{\textup}{\upshape}
         \emph Finally we have the \empty font change declaration of LATEX. The corresponding
                 definition with argument is
                 25 \DeclareTextFontCommand{\emph}{\em}
       \nocorr This is just a label, so it does nothing; it should also be unexpandable.
                 26 \let \nocorr \relax
    \check@icl We define these defaults in case some error causes them to be expanded at the
    \check@icr wrong time.
                 27 \let \check@icl \@empty
                 28 \let \check@icr \@empty
                This checks for a \nocorr as the first token in its argument and also for one in
 \text@command
                any other position not protected within braces (the latter is treated as if it were
\check@nocorr@
                at the end of the argument).
                    Is this the correct action in the 'empty' case? It is efficient but typographically
                it is, strictly, incorrect!
                 29 \def \text@command #1{%
                     \def \reserved@a {#1}%
                 30
                      \ifx \reserved@a \@empty
                 31
                 32
                        \let \check@icl \@empty
```

\space is a reserved word in IATEX or actually already in plain TEX. If somebody really redefines it so many things will break that I don't see any reason to make this routine here slower than necessary.

```
35 % \def \reserved@b { }%
```

\let \check@icr \@empty

33

```
36 %
       \ifx \reserved@a \reserved@b
      \ifx \reserved@a \space
37
38
         \let \check@icl \@empty
         \let \check@icr \@empty
39
40
         \check@nocorr@ #1\nocorr\@nil
41
42
      \fi
    \fi
43
44 }
45 \def \check@nocorr@ #1#2\nocorr#3\@nil {%
```

The two checks are initialised here to their values in the normal case.

```
46 \let \check@icl \maybe@ic
47 \def \check@icr {\ifvmode \else \aftergroup \maybe@ic \fi}%
48 \def \reserved@a {\nocorr}%
49 \def \reserved@b {#1}%
50 \def \reserved@c {#3}%
51 \ifx \reserved@a \reserved@b
52 \ifx \reserved@c \@empty
```

In this case there is a \nocorr at the start but not at the end, so \check@icl should be empty.

```
53 \let \check@icl \@empty
54 \else
```

Otherwise there is a \nocorr both at the start and elsewhere, so no italic corrections should be added.

```
55 \let \check@icl \@empty
56 \let \check@icr \@empty
57 \fi
58 \else
59 \ifx \reserved@c \@empty
```

In this case there is no \nocorr anywhere, so we need to check for an italic correction at both the beginning and the end. This has been set up as the default so no code is needed here.

```
60 \else
```

In this case there is no \nocorr at the start but there is one elsewhere, so no \aftergroup is needed.

```
61 \let \check@icr \@empty
62 \fi
63 \fi
64 }
```

\ifmaybe@ic Switch used soley within \maybe@ic not interfering with other switches.

```
65 \newif\ifmaybe@ic
```

```
\maybe@ic These macros implement the italic correction.

\maybe@ic@ 66 \def \maybe@ic {\futurelet\@let@token\maybe@ic@}
```

We first check to see if the current font is positively sloped. (But do not forget the message Rainer sent about an upright font with non-zero slope! Or is this an urban myth?) It has been suggested that this should test against a small positive value, but what?

```
68 \ifdim \fontdimen\@ne\font>\z@
69 \else
70 \maybe@ictrue
```

It would be possible, but probably not worthwhile, to continue the forward scan beyond any closing braces.

```
71 \expandafter\@tfor\expandafter\reserved@a\expandafter:\expandafter=%
72 \nocorrlist
```

We have to hide the \@let@token in the macro \t@st@ic rather than testing it directly in the loop since it might be \let to a \fi or \else, which would result in chaos.

```
73 \do \t@st@ic
```

Frank thinks that the next bit it is inefficient if done after the second change. Chris thinks that most all of this is inefficient for the commonest cases: but that is the price of a cleverer algorithm. It is certainly needed to deal with the use of \nolinebreak.

```
74 \ifmaybe@ic \sw@slant \fi
75 \fi
76 }
```

\t@st@ic

The next token in the input stream is stored in \@let@token via a \let, the current token from \nocorrlist is stored via \def in \reserved@a. To compare them we have to fiddle around a bit.

If the only things to check were characters then this could be done via an \if thus their catcodes would not matter; but this will not work whilst \futurelet is used above.

```
77 \def \t0st@ic {%
78 \expandafter\let\expandafter\reserved@b\expandafter=\reserved@a\relax
79 \ifx\reserved@b\@let@token
```

If they are the same we record the fact and jump out of the loop.

```
80 \maybe@icfalse
81 \@break@tfor
82 \fi
83 }
```

84 \def \sw@slant {%

\sw@slant \fix@penalty The definition of the mysterious \sw@slant command is as follows.

It is surely correct to put in an italic correction when there is no skip. If the last thing on the list is actually a zero skip (including things whose dimension part is zero, such as \hfill), or anything other than a character, then the italic correction will have no effect.

In order to work correctly with unbreakable spaces from ~ (and other common forms of line-breaking control) we also move back across a penalty before the glue.

```
85 \ifdim \lastskip=\z@
86 \fix@penalty
87 \else
88 \skip@ \lastskip
89 \unskip
90 \fix@penalty
91 \hskip \skip@
```

```
92 \fi
93 }
```

The above code means: "If there is a non-zero space just before the current position (\ifdim...) save the amount of that space (\skip@\lastskip), remove it (\unskip), then do a similar thing if there is a penalty just before the skip, and finally put the space back in."

Since zero glue cannot be distinguished in this context from no glue, we dare not put in an \hskip in this case as this may produce an unwanted breakpoint. This is not satisfactory.

The penalty before the glue is handled similarly, with the same caveats concerning the zero case. Is this the first recorded use of \unpenalty in standard LATEX code?

```
94 \neq fix@penalty {%}
     \ifnum \lastpenalty=\z@
95
       \@@italiccorr
96
97
     \else
       \count@ \lastpenalty
98
99
       \unpenalty
       \@@italiccorr
100
       \penalty \count@
101
102
     \fi
103 }
```

\nocorrlist

This holds the list of characters that should prevent italic correction. They should be ordered by decreasing frequency of use. If any such character is made active later on one needs to redefine the list so that the active character becomes part of it.

```
104 \def \nocorrlist {,.}
```

\nfss@text

This command will by default behave like a LATEX \mbox but may be redefined by packages such as amstext.sty to be a bit cleverer.

```
105 \ifx \nfss@text\@undefined
106 \def \nfss@text {\leavevmode\hbox}
107 \fi
```

\DeclareOldFontCommand

This is the function used to create declarative font-changing commands that can also be used to change alphabets in math-mode.

Usage: \DeclareOldFontCommand \fn{\( font-change decls \)} \( \) \( math-alphabet \) Here \fn is the font-declaration command being defined, \( \) \( font-change decls \) is the declaration it will expand to in text-mode, and \( \) \( math-alphabet \) is the (single) math alphabet specifier which is to be used in math-mode.

It does not care whether the command being defined already exists but it does give a warning if it redefines anything.

Here are some typical examples of its use in conjunction with more basic NFSS2 font commands.

```
\DeclareOldFontCommand{\rm}{\normalfont\rmfamily}{\mathrm}\DeclareOldFontCommand{\sf}{\normalfont\sffamily}{\mathtf}\DeclareOldFontCommand{\tt}{\normalfont\ttfamily}{\mathtt}
```

```
108 \def \DeclareOldFontCommand #1#2#3{%
109 \DeclareRobustCommand #1{\@fontswitch {#2}{#3}}%
110 }
```

\@fontswitch
\@@math@egroup
\@@math@egroup

These two commands actually do the necessary tests and declarative font- or alphabet-changing.

```
111 \def \@fontswitch #1#2{%
112 \ifmmode
113 \let \math@bgroup \relax
114 \def \math@egroup {\let \math@bgroup \@@math@bgroup \15 \\ \math@egroup \@@math@egroup}%
```

We need to have a \relax in the following line in case the #2 is something like \mathsf grabbing the next token as an argument. For this reason the code also uses explicit arguments again (see pr/1275).

```
116  #2\relax
117  \else
118  #1%
119  \fi
120 }
121 \let \@@math@bgroup \math@bgroup
122 \let \@@math@egroup \math@egroup
```

These commands are available only in the preamble.

```
123 \@onlypreamble \DeclareTextFontCommand 124 \@onlypreamble \DeclareOldFontCommand
```

## 50 Initialization

\normalsize This is defined to produce an error.

```
125 \def\normalsize{%
126 \@latex@error {The font size command \protect\normalsize\space
127 is not defined:\MessageBreak

## 51 Page Numbering

Page numbers are produced by a page counter, used just like any other counter. The only difference is that \c@page contains the number of the next page to be output (the one currently being produced), rather than one minus it. Thus, it is normally initialized to 1 rather than 0. \c@page is defined to be \count0, rather than a count assigned by \newcount.

\pagenumbering

The user sets the pagenumber style with the  $\pagenumbering{\langle foo\rangle}$  command, which sets the page counter to 1 and defines  $\t be \pagenumbering{roman}$  causes pages to be numbered i, ii, etc.

```
1 \*2ekernel\\
2 \message{page nos.,}
3 \countdef\c@page=0 \c@page=1
4 \def\cl@page{}
5 \def\pagenumbering#1{%
6 \global\c@page \@ne \gdef\thepage{\csname @#1\endcsname
7 \c@page}}
8 \(\frac{2ekernel}\)
```

## File x

## ltxref.dtx

## 52 Cross Referencing

The user writes  $\label{\langle foo \rangle}$  to define the following cross-references:

 $\mathbf{ref}\{\langle foo \rangle\}$ : value of most recently incremented referenciable counter. in the current environment. (Chapter, section, theorem and enumeration counters counters are referenciable, footnote counters are not.)

\pageref{ $\langle foo \rangle$ }: page number at which \label{foo} command appeared. where foo can be any string of characters not containing '\', '{'} or '}'.

Note: The scope of the \label command is delimited by environments, so \begin{theorem} \label{foo} ... \end{theorem} \label{bar} defines \ref{foo} to be the theorem number and \ref{bar} to be the current section number.

Note: \label does the right thing in terms of spacing – i.e., leaving a space on both sides of it is equivalent to leaving a space on either side.

## 52.1 Cross Referencing

```
1 (*2ekernel)
2 \message{x-ref,}
 This is implemented as follows. A referencable counter CNT is
 incremented by the command \refstepcounter{CNT} , which sets
 \colone{1.5} \co
 \label{FOO} then writes the following on file \@auxout :
                             \ensuremath{\mbox{FOO}}{{\rm eval}(\ensuremath{\mbox{currentlabel})}}{{\rm eval}(\ensuremath{\mbox{thepage}})}}
 ref{FOO} ==
          BEGIN
                   if \r@foo undefined
                             then @refundefined := G T
                                                        Warning: 'reference foo on page ... undefined'
                                                 \@car \eval(\r@FOO)\@nil
                             else
                   fi
          END
  \pageref{foo} =
          BEGIN
                   if \r@foo undefined
                             then @refundefined := G T
                                                        Warning: 'reference foo on page ... undefined'
                                                   fi
          END
```

\G@refundefinedtrue \@refundefined This does not save on name-space (since \G@refundefinedfalse was never needed) but it does make the implementation of such one-way switches more consistent. The extra macro to make the change is used since this change appears several times.

Note despite its name, \G@refundefinedtrue does not correspond to an \if command, and there is no matching ...false. It would be more natural to call the command \G@refundefined (as inspection of the change log will reveal) but unfortunately such a change would break any package that had defined a \ref-like command that mimicked the definition of \ref, calling \G@refundefinedtrue. Inspection of the TeX archives revealed several such packages, and so this command has been named ...true so that the definition of \ref need not be changed, and the packages will work without change.

```
3 % \newif\ifG@refundefined
4 % \def\G@refundefinedtrue{\global\let\ifG@refundefined\iffrue}
5 % \def\G@refundefinedfalse{\global\let\ifG@refundefined\iffalse}
6 \def\G@refundefinedtrue{%
7 \gdef\@refundefined{%
8 \@latex@warning@no@line{There were undefined references}}}
9 \let\@refundefined\relax
```

\pageref

Referencing a  $\ \$ 1abel. RmS 91/10/25: added a few extra  $\ \$ 1eset@font, as suggested by Bernd Raichle

RmS 92/08/14: made \ref and \pageref robust RmS 93/09/08: Added setting of refundefined switch.

```
10 \def\@setref#1#2#3{%
    \int ifx#1\relax
11
     \protect\G@refundefinedtrue
12
13
     \nfss@text{\reset@font\bfseries ??}%
     \@latex@warning{Reference '#3' on page \thepage \space
14
                undefined}%
15
16
    \else
     \expandafter#2#1\null
17
    fi
19 \def\ref#1{\expandafter\@setref\csname r@#1\endcsname\@firstoftwo{#1}}
20 \def\pageref#1{\expandafter\@setref\csname r@#1\endcsname
                                       \@secondoftwo{#1}}
21
```

\newlabel This command will be written to the .aux file to pass label information from one run to another.

\@newl@bel

The internal form of **\newlabel** and **\bibcite**. Note that this macro does it's work inside a group. That way the local assignments it needs to do don't clutter the save stack. This prevents large documents with many labels to run out of save stack.

```
22 \def\@newl@bel#1#2#3{{%
23 \@ifundefined{#1@#2}%
24 \relax
25 {\gdef \@multiplelabels {%
26 \@latex@warning@no@line{There were multiply-defined labels}}%
27 \@latex@warning@no@line{Label '#2' multiply defined}}%
28 \global\@namedef{#1@#2}{#3}}
```

```
29 \def\newlabel{\@newl@bel r}
30 \@onlypreamble\@newl@bel
```

\if@multiplelabels \@multiplelabels

This is redefined to produce a warning if at least one label is defined more than once. It is executed by the \enddocument command.

```
31 \let \@multiplelabels \relax
```

\label \refstepcounter

\label The commands \label and \refstepcounter have been changed to allow counter \protect'ed commands to work properly. For example,

```
\def\thechapter{\protect\foo{\arabic{chapter}.\roman{section}}}
```

will cause a \label{bar} command to define \ref{bar} to expand to something like \foo{4.d}. Change made 20 Jul 88.

\@currentlabel

For \label commands that come before any environment

```
40 \def\@currentlabel{}
```

41 (/2ekernel)

## 52.2 An extension of counter referencing

At the moment a reference to a counter foo will generate the equivalent of \p@foo\thefoo although not quite in this form. For some applications it would be nice of one could have \thefoo being an argument to \p@foo to be able to put material before and after the number generated by \thefoo. This can be easily achieved with a small change to one of the kernel commands as follows:

```
\def\refstepcounter#1{\stepcounter{#1}%
  \protected@edef\@currentlabel
    {\csname p@#1\expandafter\endcsname\csname the#1\endcsname}%
}
```

The trick is to ensure that \csname the#1\endcsname is turned into a single token before \p@... is expanded further. This way, if the \p@... command is a macro with one argument it will receive \the.... With the kernel code (i.e., without the \expandafter) it will instead pick up \csname which would be disastrous.

Using \expandafter instead of braces delimiting the argument is better because, assuming that the \p@... command is not defined as a macro with one argument, the braces will stay and prohibit kerning that might otherwise happen between the glyphs generated by \the... and surrounding glyphs.

We have refrained from making this change in the kernel code although for existing documents it would be 100% backward compatible. The reason being

that any class or package making use of this functionality would then horribly fail with older  $\LaTeX$  installations.

Instead we suggest that people who are interested in using this functionality in a document class or package add the redefinition to the class file. To ensure that this redefinition is properly applied they might want to test for the original definition first, e.g.

```
\CheckCommand*\refstepcounter[1]{\stepcounter{#1}%
    \protected@edef\@currentlabel
      {\csname p@#1\endcsname\csname the#1\endcsname}%
}
\renewcommand*\refstepcounter[1]{\stepcounter{#1}%
    \protected@edef\@currentlabel
      {\csname p@#1\expandafter\endcsname\csname the#1\endcsname}%
}
```

## ltmiscen.dtx

#### 53 Miscellaneous Environments

This section implements the basic environment mechanism, and also a few specific environments including document, The math environments and related commands, the 'flushing' environments, (center, flushleft, flushright), and verbatim.

```
_1 \langle *2ekernel \rangle
2 \message{environments,}
```

#### **Environments** 53.1

\begin{foo} and \end{foo} are used to delimit environment foo.

\begin{foo} starts a group and calls \foo if it is defined, otherwise it does

\end{foo} checks to see that it matches the corresponding \begin and if so, it calls \endfoo and does an \endgroup. Otherwise, \end{foo} does nothing.

If \end{foo} needs to ignore blanks after it, then \endfoo should globally set the @ignore switch true with \@ignoretrue (this will automatically be global).

NOTE: \@@end is defined to be the \end command of TEX82.

\enddocument is the user's command for ending the manuscript file.

```
\stop is a panic button — to end TeX in the middle.
\enddocument ==

\@currenvline

We do need a default value for \@currenvline on top-level since the document environment cancels the brace group. This means that a mismatch with \begin {document} will not produce a line number. Thus the outer default must be \@empty or we will end up with two spaces.

66 \let\@currenvline\@empty

## 53.2 Center, Flushright, Flushleft

```
67 \message{center,}
```

They invoke the trivlist environment to handle vertical spacing before and after them.

\centering, \raggedright and \raggedleft are the declaration analogs of the above.

```
\raggedright has a more universal effect, however. It sets \@rightskip := flushglue. Every environment, like the list environments, that set \rightskip to its 'normal' value set it to \@rightskip
```

```

### 53.3 Verbatim

The verbatim environment uses the fixed-width \ttfamily font, turns blanks into spaces, starts a new line for each carriage return (or sequence of consecutive carriage returns), and interprets every character literally. I.e., all special characters \, \, \\$, etc. are \catcode'd to 'other'.

The command \verb produces in-line verbatim text, where the argument is delimited by any pair of characters. E.g., \verb #...# takes '...' as its argument, and sets it verbatim in \ttfamily font.

The \*-variants of these commands are the same, except that spaces print as the TeXbook's space character instead of as blank spaces.

```

## File z

## ltmath.dtx

## 54 Math setup

This file contains a lot of the original plain TeX code, as well as the LATeX environments for math. It still needs sorting out.

```

```

## 54.1 Math commands based on plain T<sub>E</sub>X

### 54.1.1 The log-like functions

\log The standard operators:

```
3 \def\log{\mathop{\operator@font log}\nolimits}
4 \def\lg{\mathop{\operator@font lg}\nolimits}
5 \def\ln{\mathop{\operator@font ln}\nolimits}
6 \def\lim{\mathop{\operator@font lim}}
7 \def\limsup{\mathop{\operator@font lim\,sup}}
8 \def\liminf{\mathop{\operator@font lim\,inf}}
9 \def\sin{\mathop{\operator@font sin}\nolimits}
10 \def\arcsin{\mathop{\operator@font arcsin}\nolimits}
11 \def\sinh{\mathop{\operator@font sinh}\nolimits}
12 \def\cos{\mathop{\operator@font cos}\nolimits}
13 \def\arccos{\mathop{\operator@font arccos}\nolimits}
14 \def\cosh{\mathop{\operator@font cosh}\nolimits}
15 \def\tan{\mathop{\operator@font tan}\nolimits}
16 \def\arctan{\mathop{\operator@font arctan}\nolimits}
17 \def\tanh{\mathop{\operator@font tanh}\nolimits}
18 \def\cot{\mathop{\operator@font cot}\nolimits}
19 \def\coth{\mathop{\operator@font coth}\nolimits}
20 \def\sec{\mathop{\operator@font sec}\nolimits}
21 \def\csc{\mathop{\operator@font csc}\nolimits}
22 \def\max{\mathop{\operator@font max}}
23 \def\min{\mathop{\operator@font min}}
24 \def\sup{\mathop{\operator@font sup}}
25 \def\inf{\mathop{\operator@font inf}}
26 \def\arg{\mathop{\operator@font arg}\nolimits}
27 \def\ker{\mathop{\operator@font ker}\nolimits}
28 \def\dim{\mathop{\operator@font dim}\nolimits}
29 \def\hom{\mathop{\operator@font hom}\nolimits}
30 \def\det{\mathop{\operator@font det}}
31 \def\exp{\mathop{\operator@font exp}\nolimits}
32 \def\Pr{\mathop{\operator@font Pr}}
33 \def\gcd{\mathop{\operator@font gcd}}
34 \def\deg{\mathop{\operator@font deg}\nolimits}
```

And some operators have to be done by hand:

```
35 \def\bmod{%
```

 ${\tt 36} \qquad {\tt \nonscript\mskip-\mwdmuskip\mkern5mu\%}$ 

```
\mathbin{\operator@font mod}\penalty900\mkern5mu%
                                     \nonscript\mskip-\medmuskip}
                       \pmod
                                39 \def\pmod#1{%
                                     \allowbreak\mkern18mu({\operator@font mod}\,\,#1)}
                               54.1.2 Biggggg
                        \big Variants on \big and friends for use with delimiters:
                                41 \def\bigl{\mathopen\big}
                                42 \left\lceil \frac{mathrel \choose ig}{mathrel \choose ig} \right\rceil
                                43 \def\bigr{\mathclose\big}
                                44 \def\Bigl{\mathbf{Mathopen\Big}}
                                45 \left\lceil \frac{8igm{\mathbf{Bigm{\{mathrel\}Big\}}}}{2} \right\rceil
                                46 \ensuremath{\tt def\Bigr{\mathtt{Mathclose\Big}}}
                                47 \def\biggl{\mathopen\bigg}
                                48 \def\biggm{\mathbf{\underline{\underline{bigg}}}}
                                49 \def\biggr{\mathclose\bigg}
                                50 \def\Biggl{\mathopen\Bigg}
                                51 \def\Biggm{\mathrel\Bigg}
                                52 \def\Biggr{\mathclose\Bigg}
                               54.1.3 The UNSORTED Rest
                               The other math commands are lifted from plain TeX.
                        \jot
                                53 \newdimen\jot

               width zero.
               308 \def\lefteqn#1{\rlap{$\displaystyle #1$}}
  \ensuremath In math mode, \ensuremath{text} is equivalent to text; in LR or paragraph
               mode, it is equivalent to $text$. \relax is not needed in front of the \ifmmode as
               \protect will be \let to \relax. This version (due to Donald Arseneau) avoids
               duplicating its argument in the 'then' and 'else' part of the \ifmath which is
               necessary in nested 'tabular' like environments. See amslatex/2104.
               309 \DeclareRobustCommand{\ensuremath}{%
               310

               The \relax stops \ensuremath{} starting display math.
               315 \long\def\@ensuredmath#1{$\relax#1$}
               316 (/2ekernel)
```

## 54.3 External options to the standard document classes

### 54.3.1 Left equation numbering

\@eqnnum

To put the equation number on the left side of an equation we have to use a little trick. The number is shifted \displaywidth to the left inside a box of (approximately) zero width. This fails when the quation is too wide, the equation number than may overprint the equation itself.

```
317 (*leqno)
318 \renewcommand\@eqnnum{\hb@xt@.01\p@{}%
319 \rlap{\normalfont\normalcolor
320 \hskip -\displaywidth(\theequation)}}
321 (/leqno)
```

#### 54.3.2 Flush left equations

To get the displayed math environments to print the contents flush left (with an indentation) we have to redefine all of LATEX  $2_{\varepsilon}$ 's displayed math environments.

\mathindent

The amount of indentation of the equations is stored in a register.

```
322 \langle *fleqn \rangle
```

323 \newdimen\mathindent

The setting of \mathindent has to be deferred until the class file has been processed, because \leftmargini is still 0pt wide at the moment fleqn.clo is read in.

 $324 \texttt{\AtEndOfClass\{\mathindent\leftmargini\}}$ 

\[ Begin display math;

## 55 List, and related environments

The generic commands for creating an indented environment – enumerate, itemize, quote, etc – are:

```
\left( LABEL \right) \left( COMMANDS \right) \dots \right)
```

which can be invoked by the user as the list environment. The LABEL argument specifies item labeling. COMMANDS contains commands for changing the horizontal and vertical spacing parameters.

Each item of the environment is begun by the command \item[ITEMLABEL] which produces an item labeled by ITEMLABEL. If the argument is missing, then the LABEL argument of the \list command is used as the item label.

The label is formed by putting  $\mathbf{\Delta EL} \$  in an above whose width is either its natural width or else  $\mathbf{\Delta EL} \$  in an above whose width is either its natural width or else  $\mathbf{\Delta EL} \$  is larger. The  $\mathbf{\Delta EL} \$ 

```
\mbox{\mbox{\tt makelabel}} {ARG} == {BEGIN \mbox{\tt hfil}} ARG END
```

which, for a label of width less than \labelwidth, puts the label flushright, \labelsep to the left of the item's text. However, \makelabel can be \let to another command by the \list's COMMANDS argument.

A \usecounter{ $\langle foo \rangle$ } command in the second argument causes the counter foo to be initialized to zero, and stepped by every \item command without an argument. (\label commands within the list refer to this counter.)

When you leave a list environment, returning either to an enclosing list or normal text mode, LaTeX begins a new paragraph if and only if you leave a blank line after the \end command. This is accomplished by the \@endparenv command.

Blank lines are ignored every other reasonable place–i.e.:

- Between the \begin{list} and the first \item,
- Between the \item and the text of that item.
- Between the end of the last item and the \end{list}.

For an environment like quotation, in which items are not labeled, the entire environment is a single item. It is defined by letting \quotation == \list{}{...}\item\relax. (Note the \relax, there in case the first character in the environment is a '['.') The spacing parameters provide a great deal of flexability in designing the format, including the ability to let the indentation of the first paragraph be different from that of the subsequent ones.

The trivlist environment is equivalent to a list environment whose second argument sets the following parameter values:

 $\$  causes no indentation of left margin

 $\$  labelwidth = 0: see below for precise effect this has.

\itemindent = 0: with a null label, makes first paragraph have no indentation. Succeeding paragraphs have \parindent indentation. To give first paragraph same indentation, set \itemindent = \parindent before the \item[].

Every \item in a trivlist environment must have an argument—in many cases, this will be the null argument (\item[]). The trivlist environment is mainly used for paragraphing environments, like verbatim, in which there is no margin change. It provides the same vertical spacing as the list environment, and works reasonably well when it occurs immediately after an \item command in an enclosing list.

#### 55.1 List and Trivlist

The following variables are used inside a list environment:

\@totalleftmargin The distance that the prevailing left margin is indented from the outermost left margin,

\linewidth The width of the current line. Must be initialized to \hsize.

\@listdepth A count for holding current list nesting depth.

\makelabel A macro with a single argument, used to generate the label from the argument (given or implied) of the \item command. Initialized to \@mklab by the \list command. This command must produce some stretch—i.e., an \hfil.

\@inlabel A switch that is false except between the time an \item is encountered and the time that TeX actually enters horizontal mode. Should be tested by commands that can be messed up by the list environment's use of \everypar.

\box\@labels When @inlabel = true, it holds the labels to be put out by \everypar.

**@noparlist** A switch set true for a list that begins an item. No **\topsep** space is added before or after **\item**'s such a list.

Onewlist Set true by \list, set false by the first text (by \everypar).

Onoitemarg Set true when executing an \item with no explicit argument. Used to save space. To save time, make two separate \Oitem commands.

Onmbrlist Set true by \usecounter command, causes list to be numbered.

\Olistctr \def'ed by \usecounter to name of counter.

**\@noskipsec** A switch set true by a sectioning command when it is creating an in-text heading with **\everypar**.

Throughout a list environment, \hsize is the width of the current line, measured from the outermost left margin to the outermost right margin. Environments like tabbing should use \linewidth instead of \hsize.

Here are the parameters of a list that can be set by commands in the \list's COMMANDS argument. These parameters are all TeX skips or dimensions (defined by \newskip or \newdimen), so the usual TeX or LATeX commands can be used to set them. The commands will be executed in vmode if and only if the \list was preceded by a \par (or something like an \end{list}), so the spacing parameters can be set according to whether the list is inside a paragraph or is its own paragraph.

## 55.2 Vertical Spacing (skips)

**\topsep:** Space between first item and preceding paragraph.

\partopsep: Extra space added to \topsep when environment starts a new paragraph (is called in vmode).

\itemsep: Space between successive items.

\parsep: Space between paragraphs within an item – the \parskip for this environment.

### 55.3 Penalties

\Obeginparpenalty: put at the beginning of a list

\@endparpenalty: put at end of list

\@itempenalty: put between items.

## 55.4 Horizontal Spacing (dimens)

\leftmargin: space between left margin of enclosing environment (or of page if top level list) and left margin of this list. Must be nonnegative.

\rightmargin: analogous.

\listparindent: extra indentation at beginning of every paragraph of a list except the one started by the \item command. May be negative! Usually, labeled lists have \listparindent equal to zero.

\itemindent: extra indentation added right BEFORE an item label.

\labelwidth: nominal width of box that contains the label. If the natural width of the label <= \labelwidth, then the label is flushed right inside a box of width \labelwidth (with an \hfil). Otherwise, a box of the natural width is employed, which causes an indentation of the text on that line.

\labelsep: space between end of label box and text of first item.

### 55.5 Default Values

Defaults for the list environment are set as follows. First, \rightmargin, \listparindent and \itemindent are set to Opt. Then, one of the commands \@listi, \@listii, ..., \@listvi is called, depending upon the current level of the list. The \@list ... commands should be defined by the document style. A convention that the document style should follow is to set \leftmargin to \leftmargini,..., \leftmarginvi for the appropriate level. Items that aren't changed may be left alone, but everything that could possibly be changed must be reset.

```
\left\{ LABEL \right\} \left\{ COMMANDS \right\} ==
         BEGIN
                if \clistdepth > 5
                       then LaTeX error: 'Too deeply nested'
                       else \ensuremath{\texttt{Olistdepth}}\ := G \ensuremath{\texttt{Colistdepth}}\ +\ 1
                fi
                \rightmargin
                                                                        := 0pt
                \ := 0pt
                \itemindent

#### \par@deathcycles

#### 56 \newcount\par@deathcycles

#### \@trivlist

Because \par is sometimes made a no-op it is possible for a missing \item to produce a loop that does not fill memory and so never gets trapped by TEX. We thus need to trap this here by seting \par to count the number of times a paragraph ii is called with no progress being made started.

```

       \@endparenv
121
     \fi
122 }
```

\@endparenv \@doendpe To suppress the paragraph indentation in text immediately following a paragraph-making environment, \everypar is changed to remove the space, and \par is

redefined to restore \everypar. Instead of redefining \par and \everypar, \@endparenv was changed to set the @endpe switch, letting \end redefine \par and \everypar.

This allows paragraph-making environments to work right when called by other environments. (Changed 27 Oct 86)

```
123 \def\@endparenv{%
124 \addpenalty\@endparpenalty\addvspace\@topsepadd\@endpetrue}
125 \langle \lan
```

If a section heading changes \clubpenalty to keep lines after it together then this modification is restored via the \everypar mechanism at the start of the next paragraph. As we destroy the contents of this token here we explicity set \clubpenalty back to its default.

```
128 \clubpenalty\@clubpenalty
129 \everypar{}\par\@endpefalse}\everypar
```

Use \setbox0=\lastbox instead of \hskip -\parindent so that a \noindent becomes a no-op when used before a line immediately following a list environment(23 Oct 86).

\hskip \leftmargin}%

182

The paragraph indent is now removed by using \setbox... since this makes \noindent a no-op here, as it should be. Thus the following comment is redundant but is left here for the sake of future historians: this next command was changed from an hskip to a kern to avoid a break point after the parindent box: the skip could cause a line-break if a very long label occurs in raggedright setting.

If \noindent was used after \item want to cancel the \itemindent skip. This case can be detected as the indentation box will be void.

```
185
          {\setbox\z@\lastbox
186
           \ifvoid\z@
187
             \kern-\itemindent
188
           fi}%
          \box\@labels
189
190
          \penalty\z@
191
```

This code is intended to prevent a page break after the first line of an item that comes immediately after a section title. It may be sensible to always forbid a page break after one line of an item? As with all such settings of \clubpenalty it is local so will have no effect if the item starts in a group.

Only resetting \@nobreak when it is true is now essential since now it is sometimes set locally.

```
\if@nobreak
                                           192
                                                                          \@nobreakfalse
                                           193
                                                                          \clubpenalty \@M

```

#### 55.6 Itemize and Enumerate

Enumeration is done with four counters: enumi, enumii, enumii and enumiv, where enumN controls the numbering of the Nth level enumeration. The label is generated by the commands \labelenumi ... \labelenumiv, which should be defined by the document style. Note that \p@enumN\theenumN defines the output of a \ref command. A typical definition might be:

```
\def\theenumii{\alph{enumii}}
\def\p@enumii{\theenumi}
\def\labelenumiii{(\theenumii)}
```

which will print the labels as '(a)', '(b)', ... and print a \ref as '3a'.

The item numbers are moved to the right of the label box, so they are always a distance of \labelsep from the item.

\@enumdepth holds the current enumeration nesting depth.

Itemization is controlled by four commands: \labelitemi, \labelitemii, \labelitemii, and \labelitemiv. To cause the second-level list to be bulleted, you just define \labelitemii to be •. \@itemspacing and \@itemdepth are the analogs of \@enumspacing and \@enumdepth.

```
\enumerate ==
                  BEGIN
                    if \ensuremath{\texttt{Qenumdepth}} > 3
                      then errormessage: "Too deeply nested".
                      else \ensuremath{\texttt{Qenumdepth}}\ := L \ensuremath{\texttt{Qenumdepth}}\ +\ 1
                             \@enumctr :=L eval(enum@\romannumeral\the\@enumdepth)
                             \list{\label(\@enumctr)}
                                   {\usecounter{\@enumctr}

## 56 LATEX Box commands

\makebox

 $\mbox[\langle wid \rangle][\langle pos \rangle]\{\langle obj \rangle\}$ 

Puts  $\langle obj \rangle$  in an \hbox of width  $\langle wid \rangle$ , positioned by  $\langle pos \rangle$ .

The possible  $\langle pos \rangle$  are:

- s stretched,
- 1 flushleft,
- r flushright,
- c (default) centred.

If  $\langle wid \rangle$  is missing, then  $\langle pos \rangle$  is also missing and  $\langle obj \rangle$  is put in an \hbox of its natural width.

 $\mbox(\langle x \rangle, \langle y \rangle) [\langle pos \rangle] \{\langle obj \rangle\}$ 

Puts  $\langle obj \rangle$  in an \hbox of width x\*\unitlength and height y\*\unitlength.  $\langle pos \rangle$  arguments are s, 1, r or c (default) for stretched, flushleft, flushright or centred, and t or b for top, bottom – or combinations like tr or rb. Default for horizontal and vertical are centered. Note that in this picture mode version of \makebox a [b] aligns on the bottom of the text as documented. If you want to align on the baseline use \makebox( , )[b]{\raisebox{0pt}[height][0pt]{xyz}}} or \makebox( , )[b]{\smash{xyz}}}

\mbox

 $\mbox{\langle obj\rangle}$  The same as  $\mbox{\langle obj\rangle}$ , but is more efficient as no checking for optional arguments is done.

\newsavebox

\newsavebox{\cmd}: If \cmd is undefined, then defines it to be a TEX box register.

\savebox

\savebox{\cmd} ... : \cmd is defined to be a TEX box register, and the '...' are any \makebox arguments. It is like \makebox, except it doesn't produce text but saves the value in \box \cmd.

\sbox

 $\scalebox{\langle cmd \rangle} {\langle obj \rangle}$  is an efficient abbreviation for  $\scalebox{\langle cmd \rangle} {\langle obj \rangle}$ .

lrbox

 $\begin{lrbox}{\langle\mathit{cmd}\rangle}{\langle\mathit{text}\rangle}\begin{lrbox}{is equivalent to}\\ \begin{lrbox}{\langle\mathit{cmd}\rangle}{\langle\mathit{text}\rangle}\\ \end{lrbox}$ 

except that any white space at the beginning and end of  $\langle text \rangle$  is ignored.

\framebox

\framebox ... : like \makebox, except it puts a 'frame' around the box. The frame is made of lines of thickness \fboxrule, separated by space \fboxsep from the text - except for \framebox(X,Y) ... , where the thickness of the lines is as for the picture environment, and there is no separation added.

\fbox \parbox  $\{obj\}\$  is an abbreviation for  $\{obj\}\$ .

\parbox[\langle pos\rangle] [\langle inner-pos\rangle] {\langle width\rangle} : Makes a box with \hsize \langle width\rangle, positioned by \langle pos\rangle as follows: c:\vcenter (placed in \\$...\\$ if not in math mode) b: \vbox t:\vtop default value is c. Sets \hsize := \langle width\rangle and calls \@parboxrestore, which does the following: Restores the original definitions of:

```
//
                    \'
                   \=
                 Resets the following parameters:
                   \parindent
                                           = 0pt
                                                                            added 20 Jan 87
                   \parskip
                                                0pt
                   \linewidth
                                                \hsize
                   \cdot 0totalleftmargin = 0pt
                   \leftskip
                                           = 0pt
                   \rightskip
                                           = 0pt
                   \@rightskip
                                           = 0pt
                   \parfillskip
                                           = 0pt plus 1fil
                                                \normallineskip
                   \lineskip
                   \baselineskip
                                                \normalbaselineskip
                 Calls \sloppy
                 Note: \Carrayparboxrestore same as \Cparboxrestore but it doesn't re-
              store \.
                 minipage: Similar to \parbox, except it also makes this look like a page by
  minipage
              setting
                 \textwidth == \columnwidth == box width
                 changes footnotes by redefining:
              \ensuremath{\verb|Qmpfn|} == mpfootnote
              \thempfn == \thempfootnote
              \Official Control \Office \Ompfootnotetext
                 resets the following list environment parameters:
              \@listdepth == \@mplistdepth
              where \@mplistdepth is initialized to zero,
                 and executes \@minipagerestore to allow the document style to reset any
              other parameters it desires. It sets @minipage true, and resets \everypar to set it
              false. This switch keeps \addvspace from putting space at the top of a minipage.
                 Change added 24 May 89: \minipage sets @minipage globally; \endminipage
              resets it false.
     \rule
                 \mathbf{vile}[\langle raised \rangle] \{\langle width \rangle\} \{\langle height \rangle\} : Makes a \langle width \rangle * \langle height \rangle  rule, raised
              \langle raised \rangle.
\underline
                 \underline{\langle text \rangle}: Makes an underlined hbox with \langle text \rangle in it.
                 \raisebox
              Raises \langle box \rangle up by \langle distance \rangle length (down if \langle distance \rangle negative). Makes T<sub>F</sub>X
              think that the new box extends \langle height \rangle above the line and \langle depth \rangle below, for a
              total vertical length of \langle height \rangle + \langle depth \rangle. Default values of \langle height \rangle & \langle depth \rangle =
              actual height and depth of box in new position.
                _1 \langle *2ekernel \rangle
                2 \message{boxes,}
  \makebox \makebox User level command just looks for optional [ or (.

### \@arrayparboxrestore

Restore various paragraph parameters.

The rational for allowing two normally global flags to be set locally here was stated originally by Donald Arsenau and extended by Chris Rowley. It is because these flags are only set globally to true by section commands, and these should

never appear within boxes or, indeed, in any group; and they are only ever set globally to false when they are definitely true.

If anyone is unhappy with this argument then both flags should be treated as in **\set@nobreak**; otherwise this command will be redundant.

\@finalstrut This macro adds a special strut the depth of the box given as #1, and height and width 0pt. It is used for ensuring that the last line of a paragraph has the correct depth in 'p' columns of tables and in footnotes. In vertical mode nothing is done, as adding the strut (as done in 2.09) would start a new paragraph. It would be possible to inspect \prevdepth to check the depth of the just-completed paragraph, but we do not do that here. Actually we do even less now, skip the vmode test as it broke tabular 'p' columns. .

> The \nobreak was added (1995/10/31) to allow hyphenation of the final word of the paragraph.

```

## 57 Tabbing, Tabular and Array Environments

This section deals with 'Lining It Up in Columns'. First the tabbing environment is defined, and then in second part, tabular together with its variants, tabular\* and array.

Note that the tabular defined here is essentially the original LaTeX 2.09 version, not the extended version described in *The LaTeX Companion*. Use the array package to obtain the extended version.

## 57.1 tabbing

```
\dim(\Omega) + i = distance of tab stop i from left margin <math>0 \le i \le 15 (?).
```

\dimen\Offirsttab is initialized to \Ototalleftmargin, so it starts at the prevailing left margin.

```
\@maxtab = number of highest defined tab register
probably = \@firsttab + 12
```

\@nxttabmar = tab stop number of next line's left margin \@curtabmar = tab stop number of current line's left margin \@curtab = number of the current tab. At start of line,

it equals \@curtabmar

\@hightab = largest tab number currently defined.

 $\c$ otabpush = depth of \pushtab's

\box\@curline = contents of current line, excluding left margin

skip, and excluding contents of current field

\box\@curfield = contents of current field

be right-justified at the right margin.

\tabbingsep = distance left by the \' command between the

current position and the field that is

"left-shifted".

#### UTILITY MACROS

\@stopfield : closes the current field

\@addfield : adds the current field to the current line.

**\Ocontfield** : continues the current field **\Ostartfield** : begins the next field

\@stopline : closes the current line and outputs it

\Ostartline : starts the next line

\Cifatmargin: an \if that is true iff the current line.

#### has width zero

```

                    array and tabular environments
              ARRAY PARAMETERS:
               \arraycolsep
                    : half the width separating columns in an array environment
                    : half the width separating columns in a tabular environment
               \arrayrulewidth
                    : width of rules
               \doublerulesep
                    : space between adjacent rules in array or tabular
               \arraystretch
                    : line spacing in array and tabular environments is done by
                      placing a strut in every row of height and depth
                       \arraystretch times the height and depth of the strut
                       produced by an ordinary \strut command.
              PREAMBLE:
               The PREAMBLE argument of an array or tabular environment can
               contain the following:
                 l,r,c: indicate where entry is to be placed.
                         : for vertical rule
                 @{EXP} : inserts the text EXP in every column.
                            \arraycolsep or \tabcolsep spacing is suppressed.
                 *{N}{PRE} : equivalent to writing N copies of PRE in the preamble.
                              PRE may contain *{N'}{EXP'} expressions.
                 p{LEN} : makes entry in parbox of width LEN.
```

```
SPECIAL ARRAY COMMANDS: \multicolumn{N}{FORMAT}{ITEM} : replaces the next N column
```

items by ITEM, formatted according to FORMAT. FORMAT should contain at most one l,r or c.

If it contains none, then ITEM is ignored.

\vline: draws a vertical line the height of the current row. May appear in an array element entry.

\hline: draws a horizontal line between rows. Must appear either before the first entry (to appear above the first row) or right after a \\ command. If followed by another \hline, then adds a \vskip of \doublerulesep.

\cline{i-j} : draws horizontal lines between rows covering columns
i through j, inclusive. Multiple commands may follow
one another to provide lines covering several disjoint
columns

\extracolsep{WIDTH}: for use inside an @ in the preamble. Causes a WIDTH space to be added between columns for the rest of the columns. This is in addition to the ordinary intercolumn space.

                                  This next bit of code sets up the strut and then builds the halign and its preamble
```

This next bit of code sets up the strut and then builds the halign and its preamble according to the specification in the second argument.

This code has been moved inside the box. A side effect of this has been to expose what was a buglet in the previous version: since the \@arstrut below is expanded and contains an \ifmmode then it could produce an unnecessary extra box in every row, thus wasting 'lots of' main memory.

```
158 \setbox\@arstrutbox\hbox{%
159 \vrule \@height\arraystretch\ht\strutbox
160 \@depth\arraystretch \dp\strutbox
161 \@width\z@}%
162 \@mkpream{#2}%
163 \edef\@preamble{%
164 \ialign \noexpand\@halignto
165 \bgroup \@arstrut \@preamble \tabskip\z@skip \cr}%
That is the end of setting up the preamble; now we reset things.
```

That is the end of setting up the preamble; now we reset things before executing the halign built-up in \@preamble. The restorations could be done by introducing an extra group, thus saving tokens.

```
166 \let\@startpbox\@@endpbox\@@endpbox
167 \let\tabularnewline\\%
168 \let\par\@empty
169 \let\@sharp##%
170 \set@typeset@protect
171 \lineskip\z@skip\baselineskip\z@skip
```

If the parsing of the preamble goes wrong there my be some characters left which TEX then tries to typeset, i.e., we would be in horizontal mode. That would produce an endless loop because the \halign expects vertical mode thus issues a \par but that is a no-op at this point. So we better test this case issue some error message and make a crude recovery by ending that horizontal mode with force. A better fix would be to ensure that we never pick up more than a single character token (not done).

```

```

The command \def\@addamp{} was removed from \multicolumn on 6 Dec 86 because it caused embedded array environments not to work. I think that it was included originally to prevent an error message if the 2nd argument to the \multicolumn command had two column specifiers.

8 Feb 89 —  $\hox{}$  added after  $\protect\pro$ 

This has been made long so that, for example, a p-column can contain multiple paragraphs; maybe the arguments of @-expressions should also be able to contain multiple paragraphs.

```

             The old LATEX2.09 implementation of \cline used up quite a lot of memory and
             two precious count registers. This new (1995/09/14) implementation does not use
    \@cline
              any count registers. It is coded in a way that depends heavily on the definition of
              \multispan so that command has been moved here from the file ltplain.dtx.
                 These counters are no longer declared.

             The original had \unskip at this point, but how could a skip get here???
                   \leaders\hrule\@height\arrayrulewidth\hfill
             335
             336
             This is back spacing is fairly horrible, but it is what happened in the old version...
             An alternative would be to make \cline look ahead for a following \cline as does
              \hline. This would alter the spacing in existing documents so keep the old version
             in the kernel. Perhaps a package should do this differently.
                   \noalign{\vskip-\arrayrulewidth}}
             The \mscount counter is no longer declared, saving a csname and a register. It is
   \mscount
             declared in compatibility mode.
             Modify \multispan slightly from its plain T<sub>F</sub>X definition to allow more efficient
 \multispan
             code sharing with \mbox{multicolumn}. Also share a count register with \mbox{multiput}.

## 58 Picture Mode

Picture mode commands. In addition to the commands available in LATEX2.09, This section adds the new \quad \quad \text{qbezier} command for drawing curves.

\qbezier

\qbezier[ $\langle N \rangle$ ] ( $\langle AX,AY \rangle$ ) ( $\langle BX,BY \rangle$ ) ( $\langle CX,CY \rangle$ ) plots a quadratic Bezier curve from ( $\langle AX,AY \rangle$ ) to ( $\langle CX,CY \rangle$ ), with ( $\langle BX,BY \rangle$ ) as the third Bezier point, using N+1 points equally spaced parametrically. If N=0 (the default value), then a sufficient number of points are used to draw a connected curve—except that at most \qbeziermax + 1 points are drawn. A "point" is a square of side \\\@holewholewidth.

\bezier

In addition, to be compatible with the old bezier package, a variant of this command, \bezier, is defined, in which the first argument is not optional.

```
\unitlength
                   = value of dimension argument
\@wholewidth
                  = current line width
                  = half of current line width
\@halfwidth
\@linefnt
                  = font for drawing lines
\@circlefnt
                  = font for drawing circles
\linethickness{DIM} : Sets the width of horizontal and vertical lines
    in a picture to DIM. Does not change width of slanted lines
    or circles.
                 Width of all lines reset by \thinlines and
    \thicklines

#### CIRCLES AND OVALS

#### USER COMMANDS:

 $\circle{D}$ : Produces the circle with the diameter as close as possible to D \* \unitlength. \put(X,Y){\circle{D}}} puts the circle with its center at (X,Y).

 $\operatorname{Voval}(X,Y)$ : Makes an oval as round as possible that fits in the rectangle of width X \* \unitlength and height Y \* \unitlength. The reference point is the center.

\@ovvert {DELTA1} {DELTA2} : Makes a vbox containing either the left side or the right side of the oval being constructed. The baseline will coincide with the outside bottom edge of the oval; the left side of the box will coincide with the left edge of the vertical rule. The width of the box will be \@tempdima.

DELTA1 and DELTA2 are added to the character number in \@tempcnta

to get the characters for the top and bottom quarter circle pieces.

\convorz: Makes an hbox containing the straight rule for either the top or the bottom of the oval being constructed. The baseline will coincide with bottom edge of the rule; the left side of the box will coincide with the left side of the oval.

The width of the box will be \@ovxx.

\Ogetcirc {DIAM} : Sets \Otempcnta to the character number of the top-right quarter circle with the largest diameter less than or equal to DIAM.

Sets \Otemptoxa to an hbox containing that character.

Sets \Otemptoxa to \wd \Otemptoxa, which is the distance from the circle's left outside edge to its right inside edge.

(These characters are like those described in the

## 59 Theorem Environments

The user creates his own theorem-like environments with the command  $\mbox{\mbox{$\mbox{$newtheorem}{\langle name \rangle}}_{\langle counter \rangle}$ or <math display="block">\mbox{\mbox{$\mbox{$newtheorem}{\langle name \rangle}}_{\langle coldname \rangle}_{\langle counter \rangle}$}$ 

This defines the environment  $\langle name \rangle$  to be just as one would expect a theorem environment to be, except that it prints  $\langle text \rangle$  instead of "Theorem".

If  $\langle oldname \rangle$  is given, then environments  $\langle name \rangle$  and  $\langle oldname \rangle$  use the same counter, so using a  $\langle name \rangle$  environment advances the number of the next  $\langle name \rangle$  environment, and vice-versa.

If  $\langle counter \rangle$  is given, then environment  $\langle name \rangle$  is numbered within  $\langle counter \rangle$ . E.g., if  $\langle counter \rangle = \text{subsection}$ , then the first  $\langle name \rangle$  in subsection 7.2 is numbered  $\langle text \rangle$  7.2.1.

The way  $\langle name \rangle$  environments are numbered can be changed by redefining  $\the \langle name \rangle$ .

#### DOCUMENT STYLE PARAMETERS

\@thmcounter{COUNTER} : A command such that \edef\theCOUNTER}}

defines **\theCOUNTER** to produce a number for a theorem environment. The default is:

BEGIN \noexpand\arabic{COUNTER} END

\@thmcountersep: A separator placed between a theorem number and the number of the counter within which it is numbered.

E.g., to make the third theorem of section 7.2 be numbered 7.2-3, \@thmcountersep should be \def'ed to '-'. Its default is '.'.

 $\label{lem:lem:name} $$ \end{\text{Command that begins a theorem}} : A command that begins a theorem$ 

environment for a 'theorem' named 'NAME NUMBER' – e.g., \@begintheorem{Lemma}{3.7} starts Lemma 3.7.

\@opargbegintheorem{NAME}{NUMBER}{OPARG} :

A command that begins a theorem environment for a 'theorem' named 'NAME NUMBER' with optional

argument OPARG - e.g., \@begintheorem{Lemma}{3.7}{Jones} starts 'Lemma 3.7 (Jones):'.

\@endtheorem : A command that ends a theorem environment.

#### 60 **Sectioning Commands**

This file defines the declarations such as \author which are used by \maketitle. \maketitle itself is defined by each class, not in the LATEX kernel.

The second part of the file defines the generic commands used for defining sectioning commands such as \chapter. Again the actual document level commands are defined in the class files, in terms of these commands.

```
1 (*2ekernel)
2 \message{title,}
```

#### 60.1The Title

The user defines the title and author by the declarations  $\mathsf{title}\{\langle name \rangle\}$ , \title \author \author $\{\langle name \rangle\}$ \date

\thanks

Similarly the date is declared with  $\date{\langle date \rangle}$ .

 $\and$ 

Inside these, the  $\frac{\langle footnote\ text \rangle}{}$  command may be used to make acknowledgements, notice of address, etc. in a footnote. If there are multiple authors, they have to be separated with the \and command.

\maketitle

And finally, the \maketitle command produces the actual title, using the information previously saved with the other commands.

\title for use in \maketitle. If not given \maketitle will produce an error \@title message.

```
3 \def\title#1{\gdef\@title{#1}}
```

4 \def\@title{\@latex@error{No \noexpand\title given}\@ehc}

\author for use in \maketitle. If not given \maketitle will produce a warning \author \@author message.

```
5 \def\author#1{\gdef\@author{#1}}
```

\date for use in \maketitle. If not given \maketitle will produce \today as the default. \@date

```
7 \def\date#1{\gdef\@date{#1}}
```

8 \gdef\@date{\today}

\thanks

```
9 \def\thanks#1{\footnotemark
```

10 \protected@xdef\@thanks{\@thanks

\protect\footnotetext[\the\c@footnote]{#1}}% 11

12 }

\@thanks

13 \let\@thanks\@empty

## 60.2 Sectioning

\@secpenalty

```
19 \newcount\@secpenalty
20 \@secpenalty = -300
```

\if@noskipsec \@noskipsectrue Way back in 1991 (08/26) FMi & RmS set the \@noskipsec switch to true for the preamble and to false in \document. This was done to trap lists and related text in the preamble but it does not catch everything.

21 \newif\if@noskipsec \@noskipsectrue

\@startsection

The  $\ensuremath{\mbox{\tt Cstartsection}}{\ensuremath{\mbox{\tt Caltheading}}}{\ensuremath{\mbox{\tt Caltheading}}}{\ensuremath{\mbox{\tt Command}}}{\ensuremath{\mbox{\tt Command}}} \ensuremath{\mbox{\tt command}} \ensuremath{\mbox{\tt is optional}}.$  The part after the \*, including the \* is optional.

name: e.g., 'subsection'

**level:** a number, denoting depth of section - e.g., chapter = 0, section = 1, etc.

indent: Indentation of heading from left margin

**beforeskip:** Absolute value = skip to leave above the heading. If negative, then paragraph indent of text following heading is suppressed.

**afterskip:** if positive, then skip to leave below heading, else negative of skip to leave to right of run-in heading.

style: Commands to set style. Since June 1996 release the *last* command in this argument may be a command such as \MakeUppercase or \fbox that takes an argument. The section heading will be supplied as the argument to this command. So setting #6 to, say, \bfseries\MakeUppercase would produce bold, uppercase headings.

If '\*' is missing, then increment the counter. If it is present, then there should be no  $[\langle altheading \rangle]$  argument. The command uses the counter 'secnumdepth'. It contains a pointer to the highest section level that is to be numbered.

Warning: The \@startsection command should be at the same or higher grouping level as the text that follows it. For example, you should *not* do something like

```
\def\foo{ \begingroup ...
      \paragraph{...}
      \endgroup}
```

```
\@startsection

## 60.3 Table of Contents etc.

### 60.3.1 Convention

 $\t f@\langle foo \rangle = ext{file number for output for table foo.}$  The file is opened only if  $\t fless$  = true.

#### 60.3.2 Commands

A  $\log(type)$  { $\langle entry \rangle$ } { $\langle page \rangle$ } Macro needs to defined by document style for making an entry of type  $\langle type \rangle$  in a table of contents, etc. E.g., the document style should define  $\log(type)$  10section, etc.

**Note:** When the **\protect** command is used in the  $\langle entry \rangle$  or  $\langle text \rangle$  of one of the commands below, it causes the following control sequence to be written on the file without being expanded. The sequence will be expanded when the table of contents entry is processed.

Surprise: Inside an \addcontentsline or \addtocontents command argument, the commands: \index, \glossary, and \label are no-ops. This could cause a problem if the user puts an \index or \label into one of the commands he writes, or into the optional 'short version' argument of a \section or \caption command.

\@starttoc

The  $\ensuremath{\texttt{Qstarttoc}}\ensuremath{\langle ext \rangle}\$  command is used to define the commands:  $\t$ tableofcontents,  $\t$ listoffigures, etc.

For example:  $\cline{lof}$  is used in  $\cline{listoffigures}$ . This command reads the  $.\langle ext \rangle$  file and sets up to write the new  $.\langle ext \rangle$  file.

```
\@starttoc{EXT} ==
BEGIN
  \begingroup
   \makeatletter
   read file \jobname.EXT
IF @filesw = true
    THEN open \jobname.EXT as file \tf@EXT
FI
```

```
@nobreak :=G FALSE %% added 24 May 89
     \endgroup
   END
132 \def\@starttoc\#1{\%}
     \begingroup
133
134
       \makeatletter
       \@input{\jobname.#1}%
135
       \if@filesw
136
         \expandafter\newwrite\csname tf@#1\endcsname
137
         \immediate\openout \csname tf@#1\endcsname \jobname.#1\relax
138
       \fi
139
140
       \@nobreakfalse
141
     \endgroup}
```

#### \addcontentsline

The \addcontentsline{ $\langle table \rangle$ }{ $\langle type \rangle$ }{ $\langle entry \rangle$ } command allows the user to add his/her own entry to a table of contents, etc. The command adds the entry \contentsline{ $\langle type \rangle$ }{ $\langle entry \rangle$ }{ $\langle page \rangle$ } to the . $\langle table \rangle$  file.

This macro is implemented as an application of \addtocontents. Note that \thepage is not expandable during \protected@write therefore one gets the page number at the time of the \shipout.

```
142 \def\addcontentsline#1#2#3{%
143 \addtocontents{#1}{\protect\contentsline{#2}{#3}{\thepage}}}
```

\addtocontents

The \addtocontents{ $\langle table \rangle$ }{ $\langle text \rangle$ } command adds  $\langle text \rangle$  to the . $\langle table \rangle$  file, with no page number.

```
144 \long\def\addtocontents#1#2{%
145 \protected@write\@auxout
146 {\let\label\@gobble \let\index\@gobble \let\glossary\@gobble}%
147 {\string\@writefile{#1}{#2}}}
```

\contentsline

The \contentsline{ $\langle type \rangle$ }{ $\langle entry \rangle$ }{ $\langle page \rangle$ } macro produces a  $\langle type \rangle$  entry in a table of contents, etc. It will appear in the .toc or other file. For example, The entry for subsection 1.4.3 in the table of contents for example, might be produced by:

```
\contentsline{subsection}
{\makebox{30pt}[r]{1.4.3} Gnats and Gnus}{22}
```

The **\protect** command causes command sequences to be written without expanding them.

```
148 \def\contentsline#1{\csname l@#1\endcsname}
```

 $\cline{\langle level \rangle} {\langle indent \rangle} {\langle numwidth \rangle} {\langle title \rangle} {\langle page \rangle}$ : Macro to produce a table of contents line with the following parameters:

**level** If  $\langle level \rangle > \texttt{c@tocdepth}$ , then no line produced.

indent Total indentation from the left margin.

**numwidth** Width of box for number if the  $\langle title \rangle$  has a \numberline command. As of 25 Jan 1988, this is also the amount of extra indentation added to second and later lines of a multiple line entry.

title Contents of entry.

page Page number.

Uses the following parameters, which must be set by the document style. They should be defined with \def's.

pnumwidth Width of box in which page number is set.

tocrmarg Right margin indentation for all but last line of multiple-line entries.

dotsep Separation between dots, in mu units. Should be  $\def'd$  to a number like 2 or 1.7

#### \@dottedtocline

```
149 \def\@dottedtocline#1#2#3#4#5{%
     \ifnum #1>\c@tocdepth \else
150
       \vskip \z0 \oldsymbol{0} \plus.2\p0
151
       {\leftskip #2\relax \rightskip \@tocrmarg \parfillskip -\rightskip
152
        \parindent #2\relax\@afterindenttrue
153
        \interlinepenalty\@M
154
        \leavevmode
155
156
        \@tempdima #3\relax
        \advance\leftskip \Otempdima \null\nobreak\hskip -\leftskip
157
        {#4}\nobreak
158
        \leaders\hbox{$\m@th
159
```

If a document uses fonts other than computer modern, the use of a dot from math can be very disturbing despite the fact that this might be the only place in a document that then uses computer modern. Therefore we surround the dot with an \hbox to escape to the surrounding text font.

```
160 \mkern \@dotsep mu\hbox{.}\mkern \@dotsep
161 mu$}\hfill
162 \nobreak
163 \hb@xt@\@pnumwidth{\hfil\normalfont \normalcolor #5}%
164 \par}%
165 \fi}
```

**Note:** \nobreak's added 7 Jan 86 to prevent bad line break that left the page number dangling by itself at left edge of a new line.

Changed 25 Jan 88 to use \leftskip instead of \hangindent so leaders of multiple-line contents entries would line up properly.

#### \numberline

\numberline{ $\langle number \rangle$ }: For use in a \contentsline command. It puts  $\langle number \rangle$  flushleft in a box of width \Otempdima (Before 25 Jan 88 change, it also added \Otempdima to the hanging indentation.)

```
166 \def\numberline#1{\hb@xt@\@tempdima{#1\hfil}} 167 \langle/2ekernel\rangle
```

## File G

# ltfloat.dtx

## 61 Floats

The different types of floats are identified by a  $\langle type \rangle$  name, which is the name of the counter for that kind of float. For example, figures are of type 'figure' and tables are of type 'table'. Each  $\langle type \rangle$  has associated a positive  $\langle type \ number \rangle$ , which is a power of two. E.g.,

figures might be have type number 1, tables type number 2, programs type number 4, etc.

The locations where a float can go are specified by a  $\langle placement\ specifier \rangle$ , which is a list of the possible locations, each denoted by a letter as follows:

```
h: here — at the current location in the text.
t: top — at the top of a text page.
b: bottom — at the bottom of a text page.
p: page — on a separate float page
```

In addition, in conjunction with these, you can use '!' which means that the current values of the float positioning parameters are ignored for this float. (Has no effect on 'p', float page positioning.) For example, 'pht' specifies that the float can appear in any of three locations: page, here or top.

## 61.1 Floating Environments

```
\begin{array}{l} 1 \ \langle *2 ekernel \rangle \\ 2 \ \backslash essage\{floats,\} \end{array}
```

Where floats may appear on a page, and how many may appear there are specified by the following float placement parameters. The numbers are named like counters so the user can set them with the ordinary counter-setting commands.

```
\c@topnumber : Number of floats allowed at the top of a column. \topfraction : Fraction of column that can be devoted to floats. \c@dbltopnumber, \dbltopfraction
```

: Same as above, but for double-column floats.

\c@bottomnumber, \bottomfraction

: Same as above for bottom of page.

\c@totalnumber : Number of floats allowed in a single column,

including in-text floats.

\textfraction :Minimum fraction of column that must contain text. \floatpagefraction: Minimum fraction of page that must be taken

up by float page.

\dblfloatpagefraction

: Same as above, for double-column floats.

The document style must define the following.

File G: ltfloat.dtx Date: 2015/02/21 Version v1.2c

```
TYPE.
                \ftype@TYPE: The type number for floats of type TYPE.
                \ext@TYPE
                                                                 : The file extension indicating the file on which the
                                                                          contents list for float type TYPE is stored.
                                                                                  For example, \ext@figure = 'lof'.
                \fnum@TYPE : A macro to generate the figure number for a caption.
                                                                          For example, \forall E = Figure \the figure.
                \c \mathbb{NUM} \ TEXT :
                                                          A macro to make a caption, with NUM the value
                                                          produced by \fnum@... and TEXT the text of the caption.
                                                         It can assume it's in a \parbox of the appropriate width.
   \Ofloat{TYPE}[PLACEMENT] : This macro begins a float environment
for a
                    single-column float of type TYPE with PLACEMENT as the
placement
                    specifier. The default value of PLACEMENT is defined by
                    \fps@TYPE. The environment is ended by \end@float.
                    E.g., \figure == \Ofloat{figure}, \endfigure == \endOfloat.
        \@float{TYPE}[PLACEMENT] ==

                 18
                    The paragraph setting parameters are normalised at this point, however
                 \@parboxrestore resets \everypar which is not correct in this context so
                 \@setminipage is called if needed.
                    The float mechanism, like minipage, sets the flag @minipage true before exe-
                cuting the user-supplied text. Many LATEX constructs test for this flag and do not
                add vertical space when it is true. The intention is that this emulates TFX's 'top
                of page' behaviour. The flag must be set false at the start of the first paragraph.
                This is achieved by a redefinition of \everypar, but the call to \@parboxrestore
                 removes that redefinition, so it is re-inserted if needed. If the flag is already false
                 then the \caption was not the first entry in the float, and so some other para-
                 graph has already activated the special \everypar. In this case no further action
                is needed.
                        \@parboxrestore

\fps@dbl Note that all double floats have default fps 'tp'.

\@setfps This sets the fps, dealing with error conditions by adding the default.

\@xfloat The first part of this sets the count register that stores all the information about the type and fps of the float.

We assume here that the default specifiers already contain no active characters. It may be better to store the defaults as numbers, rather than symbol strings.

The remainder sets up the box in which the float is typeset, and the typesetting environment to be used. It is essential to have the extra box to avoid the unwanted space that would otherwise often be put at the top of the float.

It ends with a hook; not sure how useful this is but it is needed at present to deal with double-column floats.

\@floatboxreset

The rational for allowing these normally global flags to be set locally here, via \@parboxrestore, was stated originally by Donald Arseneau and extended by Chris Rowley. It is because these flags are only set globally to true by section commands, and these should never appear within marginals or floats or, indeed, in any group; and they are only ever set globally to false when they are definitely true.

If anyone is unhappy with this argument then both flags should be treated as in **\set@nobreak**; otherwise this command will be redundant.

```
174 \def \@floatboxreset {%
                            \reset@font

#### MARGINAL NOTES:

Marginal notes use the same mechanism as floats to communicate with the \output routine. Marginal notes are distinguished from floats by having a negative placement specification. The command \marginpar [LTEXT]{RTEXT} generates a marginal note in a parbox, using LTEXT if it's on the left and RTEXT if it's on the right. (Default is RTEXT = LTEXT.) It uses the following parameters.

```
\marginparwidth : Width of marginal notes.
\marginparsep : Distance between marginal note and text.
    the page layout to determine how to move the marginal
    note into the margin. E.g., \@leftmarginskip ==
    \hskip -\marginparwidth \hskip -\marginparsep .
```

Marginal notes are normally put on the outside of the page if @mparswitch = true, and on the right if @mparswitch = false. The command \reversemarginpar reverses the side where they are put. \normalmarginpar undoes \reversemarginpar. These commands have no effect for two-column output.

SURPRISE: if two marginal notes appear on the same line of text, then the second one could appear on the next page, in a funny position.

```
\marginpar [LTEXT]{RTEXT} ==
      BEGIN
              if hmode then \@bsphack
                                                                    \ensuremath{\texttt{Ofloatpenalty}} := -10002
                                                else \ensuremath{\texttt{Ofloatpenalty}} := -10003

                                                                                      343
                                                                                                                                   \color@endbox
                                                                                      344
                                                                                      345 }
```

### \@marginparreset

\marginpar

The rational for allowing these normally global flags to be set locally here, via \@parboxrestore was stated originally by Donald Arsenau and extended by Chris Rowley. It is because these flags are only set globally to true by section commands, and these should never appear within marginals or floats or, indeed, in any group; and they are only ever set globally to false when they are definitely true.

If anyone is unhappy with this argument then both flags should be treated as in **\set@nobreak**; otherwise this command will be redundant.

```
346 \def \@marginparreset {%
347 \reset@font
348 \normalsize
349 % \let\if@nobreak\iffalse
350 % \let\if@noskipsec\iffalse
351 % \@setmobreak
352 \@setminipage
353 }
```

### \@xympar

Setting the box here is done only because the code uses \end@float; it will be empty and gets discarded.

```
354 \ensuremath{\mbox{def } \ensuremath{\mbox{0xympar}}\xspace}\%
      \ifnum\@floatpenalty <\z@\@cons\@currlist\@marbox\fi
355
356
      \setbox\@tempboxa
357
         \color@vbox
            \vbox \bgroup
358
     \end@float
359
360
      \@ignorefalse
      \@esphack
361
362 }
```

## \reversemarginpar \normalmarginpar

365 \message{footnotes,}

## 61.2 Footnotes

\footnote{NOTE} : User command to insert a footnote.

\footnote[NUM]{NOTE}: User command to insert a footnote numbered NUM, where NUM is a number - 1, 2, etc. For example, if footnotes are numbered \*, \*\*, etc. within pages, then \footnote[2]{...} produces footnote '\*\*. This command does not step the footnote counter.

\footnotemark[NUM] : Command to produce just the footnote mark in the text, but no footnote. With no argument, it steps the footnote counter before generating the mark.

\footnotetext[NUM]{TEXT} : Command to produce the footnote but no mark. \footnote is equivalent to \footnotemark \footnotetext .

As in PLAIN, footnotes use \insert\footins, and the following parameters:

\footnotesize : Size-changing command for footnotes.

\footnotesep : The height of a strut placed at the beginning of

every footnote.

\skip\footins : Space between main text and footnotes. The rule

separating footnotes from text occurs in this space. This space lies above the strut of height \footnotesep which is at the beginning of the

first footnote.

\footnoterule : Macro to draw the rule separating footnotes from

text. It is executed right after a \vspace of \skip\footins. It should take zero vertical space—i.e., it should to a negative skip to compensate for any positive space it occupies.

(See PLAIN.TEX.)

\interfootnotelinepenalty: Interline penalty for footnotes.

\thefootnote: In usual LaTeX style, produces the footnote number.

If footnotes are to be numbered within pages, then
the document style file must include an \@addtoreset
command to cause the footnote counter to be reset
when the page counter is stepped. This is not a good
idea, though, because the counter will not always be
reset in time to ensure that the first footnote on a

page is footnote number one.

\@thefnmark : Holds the current footnote's mark-e.g., \dag or '1' or 'a'.

\_

\@mpfnnumber : A macro that generates the numbers for \footnote and \footnotemark commands. It == \thefootnote outside a minipage environment, but can be

outside a minipage environment, but can be changed inside to generate numbers for

\footnote's.

\@makefnmark : A macro to generate the footnote marker from

**\Othernmark** The default definition was

 $\hbox{$^\circ\0thefnmark$}.$ 

This is now replaced by \textsuperscript{\Qthefnmark}

### \@makefntext{NOTE} :

Must produce the actual footnote, using \@thefnmark as the mark of the footnote and NOTE as the text. It is called when effectively inside a \parbox, with \hsize = \columnwidth.

For example, it might be as simple as

\$^{\@thefnmark}\$ NOTE

In a minipage environment, \footnote and \footnotetext are redefined so that

- (a) they use the counter mpfootnote
- (b) the footnotes they produce go at the bottom of the minipage. The switch is accomplished by letting  $\mbox{Qmpfn} == \mbox{footnote}$  and  $\mbox{thempfn} == \mbox{thefootnote}$  or  $\mbox{thempfootnote}$ , and by redefining  $\mbox{Qfootnotetext}$  to be  $\mbox{Qmpfootnotetext}$  in the minipage.

## ltbibl.dtx

## 63 Bibliography Generation

A bibliography is created by the thebibliography environment, which generates a title such as "References", and a list of entries. The BIBTEX program will create a file containing such an environment, which will be read in by the \bibliography command. With BIBTEX, the following commands will be used.

\bibliography{ $\langle file1, file2, \ldots, filen \rangle$ }: specifies the bibdata files. Writes a \bibdata entry on the .aux file and tries to read in mainfile.bbl.

\bibliographystyle $\{\langle style \rangle\}$ : Writes a \bibstyle entry on the .aux file.

The thebibliography environment is a list environment. To save the use of an extra counter, it should use enumiv as the item counter. Instead of using \item, items in the bibliography are produced by the following commands:

\bibitem[ $\langle label \rangle$ ] { $\langle name \rangle$ }: Produces an entry labeled by  $\langle Label \rangle$  and cited by  $\langle name \rangle$ .

The former is used for bibliographies with citations like [1], [2], etc.; the latter is used for citations like [Knuth82].

The document class must define the thebibliography environment. This environment has a single argument, which is the widest bibliography label—e.g., if the [Knuth67] is the widest entry, then this argument will be Knuth67. The \thebibliography command must begin a list environment, which the \endthebibliography command ends.

\cite \nocite

\bibliography

\bibliographystyle

thebibliography

Entries are cited by the command  $\langle \text{cite} \{\langle name \rangle \}$ .

 $\nocite{\langle citations \rangle}$  puts information on the .aux file that causes BibTEX to include the  $\{\langle citations \rangle\}$  list in the bibliography, but puts nothing in the text.

           Using \hbox instead of \mbox is fine because of the \leavevmode above. In fact
           the use of a box around the citation contents is more than questionable in my
           view (FMi), but within 2e I have to keep that for compatibility reasons as it
           would probably change too many existing documents. Its main reason is to avoid
           hyphenation of labels such as [FOOB89] into [FOO-B89] so in certain styles it
```

\@biblabel : A macro to produce the label in the bibliography

entry. For \bibitem[LABEL]{NAME}, the label is

questionable.

makes sense; but, for example, in author year citations it becomes more than

So Chris added yet another hook here, as suggested by, at least, Donald Arsenau. Note that this one is inside the first argument of the \@cite hook. This decouples the top-level typesetting of the citation from the details of the other business conducted here. All this really needs a complete rethink to get the right modularity.

                     30
                          \@input@{\jobname.bbl}}
\bibliographystyle
                     32 \def\bibliographystyle#1{%
                          \ifx\@begindocumenthook\@undefined\else
                     33
                            \expandafter\AtBeginDocument
                     34
                     35
                     36
                            {\if@filesw
                     37
                               \immediate\write\@auxout{\string\bibstyle{#1}}%
                     38
                             fi}
                    (Added 14 Jun 85)
           \nocite
```

This puts information on the .aux file that causes  $BibT_{E}X$  to include the citation list in the bibliography, but puts nothing in the text.

RmS 93/08/06: Made loop for \nocite like that for \@citex, to get rid of leading spaces.

#### 39 \def\nocite#1{\@bsphack

With the implementation designed already in LATEX 2.09 the \nocite command will not work before \begin{document} since it tries to write to the .aux file which is not open before that point. As a result the "reference" will appear on the terminal and nothing else will happen.

This would be easy to fix, but then a document using the fix will silently fail on an older release of  $\LaTeX$ , missing all citations done with \nocite. Thus we do only generate an error message and leave the fix for a  $\LaTeX$ 2 $\varepsilon$  successor.

#### 40 \ifx\@onlypreamble\document

Since we are after \begin{document} we can do the citations:

```
41 \@for\@citeb:=#1\do{%

42 \edef\@citeb{\expandafter\@firstofone\@citeb}%

43 \if@filesw\immediate\write\@auxout{\string\citation{\@citeb}}\fi

44 \@ifundefined{b@\@citeb}{\G@refundefinedtrue

45 \@latex@warning{Citation '\@citeb' undefined}}{}}%

46 \else
```

File I: 1tbibl.dtx Date: 2004/02/15 Version v1.1q

But before \begin{document} we raise an error message:

47 \@latex@error{Cannot be used in preamble}\@eha

Without the compatibility problems we could fix the problem as follows:

- 48 % \AtBeginDocument{\nocite{#1}}
- 49 \fi
- 50 \@esphack}

Since \nocite{\*} should not produce a warning about undefined citation keys (seee PR 557), we need to set the control sequence '\b@\*' to something other than \relax. As a result \cite{\*} will not warn either (but that never worked with BibTeX in the first place).

51 \expandafter\let\csname b@\*\endcsname\@empty

#### 63.1 Default definitions

This hook determines the 'relative formatting' of the two logical parts of a citation with comment.

\@cite

```
52 \det @cite#1#2{[{#1\if@tempswa , #2\fi}]}
```

\@cite@ofmt

This is, in general, a command that appears to have one argument whose value is, in the kernel, a single cs whose name is the expansion of b@\@citeb; the expansion of this cs will typically be some hmode material that produces the detailed typeset form of just the citations themselves.

53 \let\@cite@ofmt\hbox

\@biblabel

```
54 \def\@biblabel#1{[#1]}
```

## 64 Page styles and related commands

#### 64.1 Page Style Commands

 $\pagestyle{\langle style \rangle}$ : sets the page style of the current and succeeding pages to style

**\thispagestyle**{ $\langle style \rangle$ }: sets the page style of the current page only to style. To define a page style style, you must define **\ps@**style to set the page style parameters.

#### 64.2 How a page style makes running heads and feet

The \ps@...command defines the macros \@oddhead, \@oddfoot, \@evenhead, and \@evenfoot to define the running heads and feet. (See output routine.) To make headings determined by the sectioning commands, the page style defines the commands \chaptermark, \sectionmark, etc., where \chaptermark{ $\langle text \rangle$ } is called by \chapter to set a mark. The \...mark commands and the \...head macros are defined with the help of the following macros.

(All the \...mark commands should be initialized to no-ops.)

#### 64.3 marking conventions

LaTeX extends TeX's \mark facility by producing two kinds of marks a 'left' and a 'right' mark, using the following commands:

 $\mathbf{\hat{\langle}} left > \mathbf{\hat{\langle}} left > \mathbf{\hat{\langle}} right > \mathbf{\hat{\langle}} right$ 

 $\mathsf{Markright}\{\langle right\rangle\}$ : Adds a 'right' mark.

 $\$  Used in the output routine, gets the current 'left' mark. Works like  $T_EX$ 's  $\$  botmark.

\rightmark: Used in the output routine, gets the current 'right' mark. Works like TeX's \firstmark. The marking commands work reasonably well for right marks 'numbered within' left marks—e.g., the left mark is changed by a \chapter command and the right mark is changed by a \section command. However, it does produce somewhat anomalous results if 2 \markboth's occur on the same page.

Commands like \tableofcontents that should set the marks in some page styles use a \@mkboth command, which is \let by the pagestyle command (\ps@...) to \markboth for setting the heading or to \@gobbletwo to do nothing.

1 (\*2ekernel)

\pagestyle User command to set the page style for this and following pages.

- 2 \def\pagestyle#1{%
- 3 \@ifundefined{ps@#1}%
- 4 \undefinedpagestyle
- 5 {\@nameuse{ps@#1}}}

```
\thispagestyle User command to set the page style for this page only.
                  6 \def\thispagestyle#1{%
                     \@ifundefined{ps@#1}%
                  8
                        \undefinedpagestyle
                        {\global\@specialpagetrue\gdef\@specialstyle{#1}}}
     \ps@empty The empty page style: No head or foot line.
                 10 \def\ps@empty{%
                     \let\@mkboth\@gobbletwo\let\@oddhead\@empty\let\@oddfoot\@empty
                     \let\@evenhead\@empty\let\@evenfoot\@empty}
     \ps@plain The plain page style: No head, centred page number in foot.
                 13 \def\ps@plain{\let\@mkboth\@gobbletwo
                         \let\@oddhead\@empty\def\@oddfoot{\reset@font\hfil\thepage
                         \hfil}\let\@evenhead\@empty\let\@evenfoot\@oddfoot}
   \@leftmark We implement \@leftmark and \@rightmark in terms of already defined com-
                mands to save token space. We can't get rid of them since they are sometimes
   \@rightmark
                used in applications.

\mark Test versions of  $\text{IAT}_{EX} 2_{\varepsilon}$  initialised  $\text{T}_{EX}$ 's \mark system at this point, but this was removed before the first release.

\AtBeginDocument{\mark{{}}}}

#### \raggedbottom

\raggedbottom typesets pages with no vertical stretch, so they have their natural height instead of all being exactly the same height. (Uses a space of .0001fil to avoid interfering with the 1fil space of \newpage.)

- $39 \ensuremath{\texttt{def}\ensuremath{\texttt{raggedbottom}\{\%\ensuremath{\texttt{%}}}}$
- \def\@textbottom{\vskip \z@ \@plus.0001fil}\let\@texttop\relax}

\flushbottom \flushbottom: Inverse of \raggedbottom — makes all pages the same height.

- 41  $\left(\frac{41 \left(\frac{1}{2}\right)}{1}\right)$
- 42 \let\@textbottom\relax \let\@texttop\relax}

\sloppy will never (well, hardly ever) produce overfull boxes, but may produce underfull ones. (14 June 85)

- 43 \def\sloppy{%
- \tolerance 9999%
- 45\emergencystretch 3em%
- 46  $\hfuzz .5\p0$
- 47 \vfuzz\hfuzz}

sloppypar A sloppypar environment is equivalent to {\par \sloppy ... \par}.

- 48 \def\sloppypar{\par\sloppy}
- $49 \endsloppypar{\pi}$

\fussy Resets TeX's parameters to their normal finicky values.

- 50 \def\fussy{%
- 51 \emergencystretch\z@
- \tolerance 200% 52
- \hfuzz .1\p@ 53
- \vfuzz\hfuzz}

\overfullrule IATEX default is no overfull box rule. Changed by document class option.

- 55 \overfullrule Opt
- 56 (/2ekernel)

### 65 Output Routine

#### 65.1 Floats

The '2ekernel' code ensures that a \usepackage{autoout1} is essentially ignored if a 'full' format is being used that has the autoload file mode already in the format.

- $_{1}\ \langle \mathsf{defx}\rangle \backslash \mathsf{begingroup}$
- 2 (defx)\makeatletter
- $3 \langle defx \rangle \nfss@catcodes$
- $4 \langle 2ekernel \rangle = \sqrt{2ekernel} = \sqrt{2ekernel}$
- 5 (\*2ekernel)
- 6 \message{output,}

#### PAGE LAYOUT PARAMETERS

\topmargin : Extra space added to top of page.

@twoside : boolean. T if two-sided printing

\oddsidemargin : IF @twoside = T

THEN extra space added to left of odd-numbered

pages.

ELSE extra space added to left of all pages.

\evensidemargin : IF @twoside = T

THEN extra space added to left of

even-numbered

pages.

\headheight : height of head

\headsep : separation between head and text

\footskip : distance separation between baseline of last

line of text and baseline of foot.

Note difference between \footSKIP and \headSEP. : height of text on page, excluding head and foot

\textheight : height of text on page, ex \textwidth : width of printing on page

\columnsep : IF @twocolumn = T

THEN width of space between columns

\columnseprule : IF @twocolumn = T

THEN width of rule between columns (0 if none).

 $\column width$  : IF @twocolumn = T

THEN (\textwidth - \columnsep)/2

ELSE \textwidth

It is set by the \twocolumn and

\onecolumn commands.

\@textbottom : Command executed at bottom of vbox holding text

of

page (including figures). The \raggedbottom

command almost \let's this to \vfil (actually sets

it to \vskip \z@ plus.0001fil).

Should have depth 0pt.

\Otexttop : Command executed at top of vbox holding text of

page (including figures). Used by letter style; can also be used to produce centered pages. Let to \relax by \raggedbottom and

\flushbottom.

Page layout must initialize \@colht and \@colroom to \textheight.

#### PAGE STYLE PARAMETERS:

\floatsep : Space left between floats.

\textfloatsep : Space between last top float or first bottom float

and the text.

\topfigrule : Command to place rule (or whatever) between floats

at top of page and text. Executed in inner vertical mode right before the **\textfloatsep** skip separating the floats from the text. Must occupy

zero vertical space. (See \footnoterule.)

\botfigrule : Same as \topfigrule, but put after the

 $\verb|\textfloatsep| skip separating text from the$ 

floats at bottom of page.

\intextsep : Space left on top and bottom of an in-text float.

\dblfloatsep : Space between double-column floats. \dbltextfloatsep : Space between top double-column floats

and text.

\dblfigrule : Similar to \topfigrule, but for double-column

floats.

\Offptop : Glue to go at top of float column - must be 0pt +

stretch

\Ofpsep : Glue to go between floats in a float column.

**\Cfpbot** : Glue to go at bottom of float column

- must be 0pt +

stretch

\@dblfptop, \@dblfpsep, \@dblfpbot

: Analogous for double-column float page in

two-column format.

FOOTNOTES: As in PLAIN, footnotes use \insert\footins.

#### PAGE LAYOUT SWITCHES AND MACROS

@twocolumn : Boolean. T if two columns per page globally.

#### PAGE STYLE MACROS AND SWITCHES

 $\colon \colon \colon$ 

THEN macro to generate head of

odd-numbered

pages.

ELSE macro to generate head of all pages.

 $\ensuremath{\verb{Gevenhead}}$  : IF @twoside = T

THEN macro to generate head of

even-numbered

pages.

**\@oddfoot** : IF @twoside = T

THEN macro to generate foot of

odd-numbered

pages.

ELSE macro to generate foot of all pages.

 $\colon \colon \colon$ 

THEN macro to generate foot of

even-numbered

pages.

@specialpage : boolean. T if current page is to have a special

format.

\@specialstyle : If its value is foo then

IF @specialpage = T

THEN the command \ps@foo is executed to temporarily reset the page style parameters

before composing the current page.

This command should execute only \def's

and

\edef's, making only local definitions.

#### FLOAT PLACEMENT PARAMETERS

The following parameters are set by the macro \@floatplacement. When \@floatplacement is called,

\@colht is the height of the page or column being built. I.e.:

\* For single-column page it equals \textheight.

\* For double-column page it equals \textheight - height of double-column floats on page.

Note that some are set globally and some locally:

 $\colony \colony \col$ 

\@toproom :=G Maximum amount of top of column devoted to floatsexcluding \textfloatsep separation below the floats and \floatsep separation between them. For

two-column output, should be computed as a function

of \@colht.

\@botnum, \@botroom

: Analogous to above.

\@colnum :=G Maximum number of floats allowed in a column, including in-text floats.

**\Otextmin** :=L Minimum amount of text (excluding footnotes) that must appear on a text page.

%% 27 Sep 85 : made local to

 $\mbox{\ensuremath{\%}{\hspace{1mu}{\hspace}$ 

\Ofpmin :=L Minimum height of floats in a float column.

The macro  $\d$  dblfloatplacement sets the following parameters.  $\d$  dbltopnum :=G Maximum number of double-column floats allowed at

the top of a two-column page.

 $\label{eq:deltoproom} \begin{tabular}{ll} $$ $$ \end{tabular} $$ \end{tabular} $$ Maximum height of double-column floats allowed at top of two-column page.$ 

 $\$  :=L Minimum height of floats in a float column. It should also perform the following local assignments where necessary – i.e., where the new value differs from the old one:

 $\begin{tabular}{lll} \tt \end{tabular} $$ \tt \end{tabular} $$ := L \end{tabular} $$ \tt \end{tabular} $$ := L \end{tabular} $$ \tt \end{tabular} $$ \tt \end{tabular} $$ := L \end{tabular} $$ \tt \end{tabular} $$ \tt \end{tabular} $$ := L \end{tabular} $$ \tt \end{tabular}$ 

#### OUTPUT ROUTINE VARIABLES

\@colht: The total height of the current column. In single column style, it equals \textheight. In two-column style, it is \textheight minus the height of the double-column floats on the current page. MUST BE INITIALIZED TO

\textheight.

**\@colroom**: The height available in the current column for text and footnotes. It equals **\@colht** minus the height of all floats committed to the top and bottom of the current column.

**\@textfloatsheight**: The total height of in-text floats on the current page.

\footins : Footnote insertion number.

\@maxdepth : Saved value of TeX's \maxdepth. Must be set when any routine sets \maxdepth.

#### CALLING THE OUTPUT ROUTINE

The output routine is called either by TeX's normal page-breaking mechanism, or by a macro putting a penalty < or = -10000 in the output list. In the latter case, the penalty indicates why the output

routine was called, using the following code.

```
penalty reason

-10000 \pagebreak
\newpage

-10001 \clearpage (\penalty -10000 \vbox{} \penalty -10001)

-10002 float insertion, called from horizontal mode

-10003 float insertion, called from vertical mode.

-10004 float insertion.
```

Note: A float or marginpar puts the following sequence in the output list: (i) a penalty of -10004,

- (ii) a null \vbox
- (iii) a penalty of -10002 or -10003.

This solves two special problems:

- 1. If the float comes right after a \newpage or \clearpage, then the first penalty is ignored, but the second one invokes the output routine.
- 2. If there is a split footnote on the page, the second 'page' puts out the rest of the footnote.

#### THE OUTPUT ROUTINE

#### FUNCTIONS USED IN THE OUTPUT ROUTINE:

\Coutputpage : Produces an output page with the contents of box \Coutputbox as the text part.

Also sets \@colht :=G \textheight.

The page style is determined as follows.

IF @thispagestyle = true

THEN use \thispagestyle style

ELSE use ordinary page style.

\@tryfcolumn\FLIST: Tries to form a float column composed of floats from \FLIST (if nonempty) with the following parameters:

\@colht : height of box

\Ofpmin : minimum height of floats in the box

 $\ensuremath{\verb{Qfpsep}}$  : interfloat space

\Ofptop : glue at top of box

**\@fpbot** : glue at bottom of box.

If it succeeds, then it does the following:

- \* \Coutputbox :=L the composed float box.
- \* @fcolmade :=G true
- \* \FLIST :=G \FLIST floats put in box
- \* \Ofreelist :=G \Ofreelist + floats put in box

If it fails, then:

\* @fcolmade :=G false

NOTE: BIT MUST BE A SINGLE TOKEN!

\@makefcolumn \FLIST: Same as \@tryfcolumn except that it fails to make a float column only if \FLIST is empty.

Otherwise, it makes a float column containing at least the first box in \FLIST, disregarding \@fpmin.

#### \@startcolumn :

Calls \@tryfcolumn\@deferlist. If \@tryfcolumn returns with (globally set) @fcolmade = false, then:

- \* Globally sets \@toplist and \@botlist to floats from \@deferlist to go at top and bottom of column, deleting them from \@deferlist. It does this using \@colht as the total height, the page style parameters \@floatsep and \@textfloatsep, and the float placement parameters \@topnum, \@toproom, \@botnum, \@botroom, \@colnum and \textfraction.
- \* Globally sets \@colroom to \@colht minus the height of the added floats.

#### **\@startdblcolumn**:

Calls \Otryfcolumn\Odbldeferlist{8}. If \Otryfcolumn returns with (globally set) Ofcolmade = false, then:

- \* Globally sets \@dbltoplist to floats from \@dbldeferlist to go at top and bottom of column, deleting them from \@dbldeferlist.

  It does this using \textheight as the total height, and the parameters \@dblfloatsep, etc.
- \* Globally sets \@colht to \textheight minus the height of the added floats.

putting the new box in \@outputbox. It uses \floatsep and \textfloatsep for the appropriate separations. It puts the elements of \TOPLIST and \BOTLIST onto \@freelist, and makes those lists null.

\@makecol: Makes the contents of \box255 plus the accumulated footnotes, plus the floats in \@toplist and \@botlist, into a single column of height \@colht (unless the page height has been locally changed), which it puts into box \@outputbox. It puts boxes in \@midlist back onto \@freelist and restores \maxdepth.

 $\label{eq:copcol} \begin{tabular}{ll} \tt Qoutputs a column whose text is in box \verb+\Qoutputbox+ & If $\mathbb{Q}$ two column = false, then it calls \verb+\Qoutputpage+, sets $\mathbb{Q}$ is $\mathbb{C}$ textheight, and calls $\mathbb{Q}$ lostplacement.$ 

If @twocolumn = true, then:

If @firstcolumn = true, then it puts box \Coutputbox into \Cleftcolumn and sets @firstcolumn :=G false.

If @firstcolumn = false, then it puts out the current two-column page, any possible two-column float pages, and determines \@dbltoplist for the next page.

# USER COMMANDS THAT CALL OR AFFECT THE OUTPUT ROUTINE

 $\mbox{\ensuremath{\mbox{\sc ND}}} = \mbox{\ensuremath{\mbox{\sc BEGIN \par\vfil\penalty}} -10000 \mbox{\ensuremath{\mbox{\sc END}}}$ 

 $\verb|\clearpage| == BEGIN \\ \verb|\newpage|$ 

 $\verb|\penalty -10001||$ 

END

 $\cline{A}$  \clearpage == BEGIN \clearpage

if @twoside = true and c@page is even then \hbox{} \newpage fi

END

\twocolumn[BOX] : starts a new page, changing to twocolumn setting and puts BOX in a parbox of width \textwidth across the top.
Useful for full-width titles for double-column pages.

SURPRISE: The stretch from \@dbltextfloatsep will be inserted between the BOX and the top of the two columns.

#### FLOAT-HANDLING MECHANISMS

The float environment obtains an insertion number B from the **\Offreelist** (see below for a description of list manipulation), puts the float into box B and sets **\count** B to a FLOAT SPECIFIER. For a normal (not double-column) float, it then causes a page break in one of the following two ways:

- In outer hmode: \vadjust{\penalty -10002}
- In vmode: \penalty -10003.

For a double-column float, it puts B onto the \@dbldeferlist.

- The float specifier has two components:
  - \* A PLACEMENT SPECIFICATION, describing where the float may be placed.
  - \* A TYPE, which is a power of two-e.g., figures might be

type 1 floats, tables type 2 floats, programs type 4 floats, etc. The float specifier is encoded as follows, where bit 0 is the least significant bit.

Bit	Meaning
—	<del></del>
0	1 iff the float may go where it appears in the text.
1	1 iff the float may go on the top of a page.
2	1 iff the float may go on the bottom of a page.
3	1 iff the float may go on a float page.
4	1 unless the PLACEMENT includes a !
5	1 iff a type 1 float
6	1 iff a type 2 float
etc.	

A negative float specifier is used to indicate a marginal note.

#### MACROS AND DATA STRUCTURES FOR PROCESSING FLOATS

A FLOAT LIST consisting of the floats in boxes \boxa ... \boxN has the form:

```
 \@elt \boxa ... \@elt \boxN
where \boxI is defined by
 \newinsert\boxI
```

Normally, \@elt is \let to \relax. A test can be performed on the entire float list by locally \def'ing \@elt appropriately and executing the list.

This is a lot more efficient than looping through the list.

The following macros are used for manipulating float lists.

\@bitor\NUM\LIST : Globally sets switch @test to the disjunction for all I of bit log2 \NUM of the float specifiers of all the floats in \LIST.

I.e., @test is set to true iff there is at least one float in \LIST having bit log2 \NUM of its float specifier

File K: ltoutput.dtx Date: 2017/04/11 Version v1.4a

equal to 1.

```
Note: \log 2 \left[ (\text{count I})/32 \right] is the bit number corresponding to the
type of float I. To see if there is any float in \LIST having
the same type as float I, you run \@bitor with
  \mathbb{NUM} = [(\mathbb{1}/32] * 32.
\@bitor\NUM\LIST ==
 BEGIN
    @test :=G false
    if \count\CTR / \NUM is odd
                            then @test := true
                                                    fi fi
      \LIST
    }
 END
\@cons\LIST\NUM : Globally sets \LIST := \LIST * \@elt \NUM
\@cons\LIST\NUM ==
 \LIST := G \LIST \@elt \NUM
BOX LISTS FOR FLOAT-PLACEMENT ALGORITHMS
  \@freelist
                 : List of empty boxes for placing new floats.
                 : List of floats to go at top of current column.
  \@toplist
  \@midlist
                 : List of floats in middle of current column.
  \@botlist
                 : List of floats to go at bottom of current column.
  \@deferlist
                 : List of floats to go after current column.
  \@dbltoplist : List of double-col. floats to go at top of current
                    page.
  \Odbldeferlist : List of double-column floats to go on subsequent
                    pages.
FLOAT-PLACEMENT ALGORITHMS
\@addtobot : Tries to put insert \@currbox on \@botlist.
             Called only when:
                 * type of \@currbox not on \@deferlist
                * \c 0
                * @insert = false
             If it succeeds, then:
                * sets @insert true
                * decrements \@botroom by \ht BOX
                * decrements \@botnum and \@colnum by 1
```

```
* decrements \@colroom by \ht BOX + either
\floatsep
                     or \textfloatsep, as appropriate.
                   * sets \maxdepth to 0pt
  \@addtotoporbot : Tries to put insert \@currbox on \@toplist or
                     \@botlist.
                     Called only under same conditions as \Qaddtobot.
                     If it succeeds, then:
                         * sets @insert true
                         * decrements \@toproom or \@botroom by \ht
BOX
                         * decrements \@colnum and either \@topnum or
                           \@botnum by 1
                         * decrements \colonome by \t BOX +
\floatsep
                           or \textfloatsep, as appropriate.
 \@addtocurcol : Tries to add \@currbox to current column, setting
                  @insert true if it succeeds, false otherwise.
                  It will add \@currbox to top only if bit 0 of
                  \count \@currbox is 0, and to the bottom only if
                  bit 0 = 0 or an earlier float of the same type is
                  put on the bottom.
                  If the float is put in the text, then
                  \penalty\interlinepenalty is put
                  right after the float, before the following \vskip,
                  and \outputpenalty :=L 0.
 \@addtonextcol : Tries to add \@currbox to the next column, setting
                   @insert true if it succeeds, false otherwise.
 \@addtodblcol : Tries to add \@currbox to the next double-column page,
                  adding it to \@dbltoplist if it succeeds and
                  \@dbldeferlist if it fails.

The new algorithm stores page wide floats together with column floats in a single \@deferlist list. We keep \@dbldeferlist initialised as empty so that packages that are testing for deferred floats can use the same code for old or new float handling.

70 \gdef\@dbldeferlist{}

#### PAGE LAYOUT PARAMETERS

- 71 \newdimen\topmargin
- 72 \newdimen\oddsidemargin
- 73 \newdimen\evensidemargin
- 74 \let\@themargin=\oddsidemargin
- 75 \newdimen\headheight
- 76 \newdimen\headsep
- 77 \newdimen\footskip
- 78 \newdimen\textheight
- 79 \newdimen\textwidth
- 80 \newdimen\columnwidth
- 81 \newdimen\columnsep
- 82 \newdimen\columnseprule
- 83 \newdimen\marginparwidth
- 84 \newdimen\marginparsep
- 85 \newdimen\marginparpush

\AtBeginDvi \@begindvibox

We use a box register in which to put stuff that must appear before anything else in the .dvi file.

The stuff in the box should not add any typeset material to the page when it is unboxed.

```
86 \newbox\@begindvibox
```

87 \def \AtBeginDvi #1{%

\global \setbox \@begindvibox

\vbox{\unvbox \@begindvibox #1}% 89

90 }

\@maxdepth

This is not the right place to set this; it needs to be set in a class/style file when \maxdepth is set.

Also, many settings to \maxdepth should be to \@maxdepth, probably?

- 91 \newdimen\@maxdepth
- 92 \@maxdepth = \maxdepth

\paperheight \paperwidth New \paper... registers.

93 \newdimen\paperheight

94 \newdimen\paperwidth

\if@fcolmade

\if@insert Local switches first:

95 \newif \if@insert \if@specialpage

\if@firstcolumn

These should definitely be global:

\if@twocolumn

96 \newif \if@fcolmade

\if@twoside

\col@number

97 \newif \if@specialpage \@specialpagefalse

\if@reversemarginpar \if@mparswitch

These should be global but are not always set globally in other files.

```
98 \newif \if@firstcolumn \@firstcolumntrue
99 \newif \if@twocolumn \@twocolumnfalse
```

Not sure about these: two questions. Should things which must apply to a whole document be local or global (they probably should be 'preamble only' commands)? Are these three such things?

```
100 \newif \if@twoside \@twosidefalse
101 \newif \if@reversemargin \@reversemarginfalse
102 \newif \if@mparswitch \@mparswitchfalse
This counter has been imported from 'multicol'.
103 \newcount \col@number
```

```

\newpage

The two checks at the beginning ensure that an item label or run-in section title immediately before a \newpage get printed on the correct page, the one before the page break.

All three tests are largely to make error processing more robust; that is why they all reset the flags explicitly, even when it would appear that this would be done by a \leavevmode.

```

165
```

The \vfil at the end of the macro before the break penalty will normally result in the page being run short, even with \flushbottom in effect (in contrast to the behavior of \pagebreak). However, if there is some explicit stretch on the page, say, a \vfill, it has the undesired side-effect, that the last line will not align at its baseline if it contains characters going below the baseline, as the value of \prevdepth is no longer taken into account by TeX. So we back up by that amount (or by \maxdepth if it is really huge), to mimic the normal behavior without the \newpage.

227 \fi
```

This next line is not essential but it is more robust to make this value non-zero, in case of weird errors.

This next bit is what is needed from **\@addtodblcol**, plus some extra checks for error trapping.

```
\global \count\@currbox \tw@
228
     \@tempdima -\ht\@currbox
229
230
     \advance \@tempdima -\dbltextfloatsep
231
     \global \advance \@colht \@tempdima
232
     \ifx \@dbltoplist \@empty
233
     \else
       \@latexerr{Float(s) lost}\@ehb
234
       \let \@dbltoplist \@empty
235
236
237
     \@cons \@dbltoplist \@currbox
```

This setting of \Odbltopnum is used only to change the typesetting in \Ocombinedblfloats.

```
238 \global \@dbltopnum \m@ne  
239 \sqrt{trace}  
240 \fl@trace{dbltopnum set to -1 (= \the \@dbltopnum) (topnewpage)}%  
241 \sqrt{trace}
```

At points such as this we need to check that there is still a minimal amount of room left on the page; this uses an arbitrary small value at present; but note that this value is larger than that used when checking that page is too full of normal floats.

If there is little room left we just force a page-break, OK? This involves producing two empty columns. The second empty column may be produced by \output, in which case an extra, misleading, warning will be generated, OK? (This happens only when there is too little room left on the page for any float.) Otherwise (i.e. if the size is such that it is allowed as a normal float) the extra \@emptycol will be invoked in the second column by the conditional code guarded by the \if@firstcolumn test.

I now think that the cut-off point here should be 3\baselineskip, but we make it a bit less so that 3 lines of text will be allowed, OK?

Since this happens only when there is nothing on the page but the 'top-box', the empty box should not cause any problem other than some overfull box messages, which is not entirely misleading.

Here we need two page-ends since both columns need to be empty.

```
\ifdim \@colht<2.5\baselineskip
242
       \@latex@warning@no@line {Optional argument of \noexpand\twocolumn
243
                    too tall on page \thepage}%
244
       \@emptvcol
245
       \if@firstcolumn
246
       \else
247
248
         \@emptycol
249
       \fi
250
     \else
251
       \global \vsize \@colht
       \global \@colroom \@colht
252
       \@floatplacement
253
     \fi
254
255 }
```

#### \output \@specialoutput

This needs some small adjustments. We cannot guarantee that the float mechanism will interact correctly with this stuff, but that mechanism does not always work properly with footnotes already.

RmS 91/09/29:

added reset of \par to the output routine. This avoids problems when the output routine is called within a list where \par may be a no-op.

```
256 \output {%
257 \let \par \@@par
258 \ifnum \outputpenalty<-\@M
259 \@specialoutput
260 \else
261 \@makecol
262 \@opcol
Moved to \@opcol: \@floatplacement.
```

263 \@startcolumn

This loop could be replaced by an \expandafter tail recursion in \@startcolumn.

```
264 \@whilesw \if@fcolmade \fi
265 {%
266 \setminus \text{trace}}
267 \fl@trace{PAGE: float \if@twocolumn column \else page \fi
268 completed}%
269 \setminus \text{trace}
270 \@opcol\@startcolumn}%
271 \fi
272 \ifnum \outputpenalty>-\@Miv
```

At points such as this we need to check that there is still a minimal amount of room left on the page; this uses an arbitrary small value at present. If there is little room left we just force a page-break, OK?

This bit is essential only if a float has just been processed so maybe it should be moved; but this is the natural place at which to set the vsize and a test would need to be done anyway. A check has been added to ensure that there really has been a change in the value of \@colroom.

Since this happens only when there is nothing on the page but floats, the empty box should not cause any problem other than some overfull box messages, which is not entirely misleading.

The twocolumn case does not need any extra code here since this is the **\output** itself; in the second column there will still not be enough room left so **\@emptycol** will be executed again when the OR is called by the-page builder when it gets to the penalty inserted by the first execution. (The page-builder is never invoked whilst the OR is being executed since it builds a inner vlist; thus any conditional code for the two-column case within **\output** may not get executed with the correct value of **\ifferistcolumn**.

```

 CHANGES TO \@specialoutput:
 * \penalty\z@ changed to \penalty\interlinepenalty so \samepage
   works properly with figure and table environments.
   (Changed 23 Oct 86)
 * Definition of \@specialoutput changed 26 Feb 88 so \@pageht and
   \@pagedp aren't changed for a marginal note.
   (Change suggested by Chris Rowley.)
294 \gdef\@specialoutput{%
      \ifnum \outputpenalty>-\@Mii
295
296
        \@doclearpage

299
300
          \global \setbox\@holdpg \vbox {\unvbox\@cclv}%
301
```

Note that \boxmaxdepth should not be set here since we wish to record the natural depth of the holdpg box.

This is changed so as to not lose anything, such as writes and marks, which may get into box 255 and should be returned to the list. This should only happen

when the first penalty in the mechanism is discarded and therefore \@holdpg should always be void in this case. This can happen because a penalty is discarded whenever there is no box on the list.

It was just: \setbox\@tempboxa \box \@cclv.

The last box which is removed is the box put there by the double-penalty mechanism. The \unskip then removes the \topskip which is put there since the box is the first on the page.

```
302 \global \setbox\@holdpg \vbox{%
303 \unvbox\@holdpg
304 \unvbox\@cclv
```

We must now remove the box added by the float mechanism and the \topskip glue therefore added above it by TeX.

```
305 \setbox\@tempboxa \lastbox
306 \unskip
307 \}%
```

These two are needed as separate dimensions only by \@addmarginpar; for other purposes we put the whole size into \@pageht (see below).

```
308 \@pagedp \dp\@holdpg
309 \@pageht \ht\@holdpg
310 \unvbox \@holdpg
311 \@next\@currbox\@currlist{%
312 \ifnum \count\@currbox>\z@
```

Putting the whole size into \@pageht (see above).

```
313 \advance \@pageht \@pagedp
314 \ifvoid\footins \else
315 \advance \@pageht \ht\footins
316 \advance \@pageht \skip\footins
317 \advance \@pageht \dp\footins
318 \fi
319 \ifvbox \@kludgeins
```

We want to make the adjustment due to this insert only if the non-star form is used. The \*-form will probably not work with floats, but maybe it still could make some adjustment here even so?

```
320 \ifdim \wd\@kludgeins=\z@
321 \advance \@pageht \ht\@kludgeins

323 \fl@trace \Extra size added: \the \ht\@kludgeins}\%
324 \/trace\
325 \fi
326 \fi
```

This version puts the inserts back just before the additional material; it could be moved earlier, before unboxing the page-so-far. Neither is guaranteed not to put things on the wrong page. This version is similar to the original version.

```
327 \@reinserts
328 \@addtocurcol
329 \else
330 \@reinserts
331 \@addmarginpar
332 \fi
333 }\@latexbug
```

A 2e change: use \addpenalty instead of \penalty here. Some penalty is needed to create a potential break-point immediately after the reinserts (or the marginal). Otherwise there can be no possibility to break here and this can cause the reinserts or the marginal to appear on the next page (which is often incorrect). However, if the nobreak flag is true, a \nobreak must be correct.

```

\@doclearpage

This is a very much an emergency action, just dumping everything: footnotes first then floats. A more sophisticated version is needed; but even more urgent is a bug-free version (see, for example, pr/3528).

Also, it puts any left-over non-boxes (writes, specials, etc.) back after any float pages created: this is a very bad bug since, for example, a kludge insert will be in quite the wrong place and, worse, be irremovable and uncancelable.

All the remaining changes are replacing the double column defer list or inserting the extra test  $\{0 \text{ testwrongwidth} \{\langle box \rangle\} \}$  at suitable places. That is at places where a box is taken off the deferlist.

```

          472
          473 (/trace)
          Not needed since it comes after \@outputpage:
                   \global\@colht\textheight
          474 %
          475
```

These do not need to be done every time \@opcol is used: they should be grouped together since they all need to be done at the end of the non-special output routine, or at the end of a clearpage one.

\@makecol We must rewrite this macro to allow for variations in page-makeup required by changes in page-length.

This uses a different macro if a special-length column is being produced.

```
480 (*2ekernel)
481 \gdef \@makecol {%
482 \ifvoid\footins
483 \setbox\@outputbox \box\@cclv
484 \else
485 \setbox\@outputbox \vbox {%
```

This \boxmaxdepth setting is to ensure that deep footnotes do not overwrite the footer (on account of the negative skip added later): it should use \@maxdepth otherwise the change is pointless when there are footnotes.

But see also its use when combining floats.

```
\boxmaxdepth \@maxdepth
486
487 %
            \@tempdima\dp\@cclv
           \unvbox \@cclv

           \color@endgroup
495
496
           }%
      \fi
497
```

File K: ltoutput.dtx Date: 2017/04/11 Version v1.4a

The h floats have now been finally committed to this page so we can reset their list. The top and bottom floats are then added to the page.

```
498 \let\@elt\relax
499 \xdef\@freelist\@midlist}%
500 \global \let \@midlist \@empty
501 \@combinefloats
```

The variations start here in case \enlargethispage has been used.

```
502 \ifvbox\@kludgeins
503 \@makespecialcolbox
504 \else
```

This extra reboxing is only needed to add the **\@texttop** and **\@textbotttom** but this could be done earlier, when the floats are added.

The \boxmaxdepth resetting here will have no effect unless \@textbottom ends with a box or rule. So is this (or possibly \@maxdepth) the correct value?

The \vskip -\dimen@ ensures that the visible depth of the box does not affect the placement of anything on the page. Thus very deep pages will overprint the footer; but these should have been prevented by suitable settings of the maxdepths at appropriate times.

If \@textbottom ends with a box or rule of non-zero depth then this skip adjustment should be done again after it.

I think that the final boxing of the main text page could have a common ending which may make it simpler to see what is going on.

This needs further investigation, especially in the 'special case'.

Also, the \boxmaxdepth setting here affects what happens within \@texttop and \@textbottom, should it? Is it needed at all?

RmS 91/10/22: Replaced \dimen128 by \dimen0.

```
505
         \setbox\@outputbox \vbox to\@colht {%
506 %
            \boxmaxdepth \maxdepth
                                                         %??
           \@texttop
507
508
           \dimen@ \dp\@outputbox
           \unvbox \@outputbox
509
           \vskip -\dimen@
510
           \@textbottom
511
           }%
512
      \fi
513
       \global \maxdepth \@maxdepth
514
515 }
```

\@reinserts

This is the code which reinserts the inserts. It puts them all in one place; this can make some of them come out on the wrong page. It has been put into a separate macro to expedite experimentation.

```
516 \gdef \@reinserts{%
517 \ifvoid\footins\else\insert\footins{\unvbox\footins}\fi
518 \ifvbox\@kludgeins\insert\@kludgeins
519 {\unvbox\@kludgeins}\fi
520 }
521 \( /2ekernel \)
```

\@makespecialcolbox

This implements certain variations in page-makeup.

```
522 (*2ekernel | fltrace)
```

First we find the natural height of the column.

See above for discussion of what is happening here.

This needs further investigation, especially in this 'special case'.

```
529
      \setbox\@outputbox \vbox {%
530
         \@texttop
531
         \dimen@ \dp\@outputbox
        \unvbox\@outputbox
532
        \vskip-\dimen@
533
        }%
534
535
      \@tempdima \@colht
536
      \ifdim \wd\@kludgeins>\z@
```

Note that in this case (the \*-version), the height of the \@kludgeins box is not used since its value is somewhat arbitrary: it need only be big enough to ensure that the page-break is not taken prematurely.

Here we calculate how much vertical space needs to be added in order to enable the column to fit into a box of size \@colht using the best information we have about the amount of shrink available (another thing which is known internally about a box, but cannot be accessed at the TeX level!).

This needs TEX3 otherwise \pageshrink is zero anyway; it may not be exactly the figure we wish as it is the total available from the all the material collected before the page-break decision is made. It will, we think, always be an overestimate of the actual shrink in the box; therefore this should always force the shortest possible column with the possibility of an overfull box.

This should work for bothe flush- and ragged-bottom setting since it makes the contents no smaller than the size (\@colht) of the box into which they are put.

Their should perhaps be an upper limit, of 0pt?, on the extra space added to force shrinking.

See above for a discussion of the \boxmaxdepth setting here.

```
537
        \advance \@tempdima -\ht\@outputbox
538
        \advance \@tempdima \pageshrink
539 (*trace)
        \fl@trace {Natural ht of col: \the \ht\@outputbox}%
540
541
        \fl@trace {\string \@colht: \the \@colht}%
542
        \fl@trace {Pageshrink added: \the \pageshrink}%
543
        \fl@trace {Hence, space added: \the \@tempdima}%
544 (/trace)
        \setbox\@outputbox \vbox to \@colht {%
545
           \boxmaxdepth \maxdepth
546 %
547
           \unvbox\@outputbox
           \vskip \@tempdima
548
           \@textbottom
549
550
```

For the unstarred version, the final size of the page is precisely specified. Therefore,

at least for the flush-bottom case, we need to ensure that, visually, it has this size exactly.

Thus we calculate this size and set the material in a box of this size, which is then put into a box of size \@colht with \vss at the bottom.

```
551 \else
552 \advance \@tempdima -\ht\@kludgeins
553 \*trace\
554 \fl@trace {\Natural ht of col: \the \ht\@outputbox}\%
555 \fl@trace {\string \@colht: \the \@colht}\%
556 \fl@trace {Extra size added: -\the \ht \@kludgeins}\%
557 \fl@trace {Hence, height of inner box: \the \@tempdima}\%
558 \fl@trace {Max? pageshrink available: \the \pageshrink}\%
559 \/trace\
```

This type of final packaging could be done always; this may simplify all of this page-makeup.

It is not necessary to set  $\begin{tabular}{l} \begin{tabular}{l} \be$ 

```
560 \setbox \@outputbox \vbox to \@colht {%
561     \vbox to \@tempdima {%
562     \unvbox\@outputbox
563     \@textbottom}%
564     \vss}%
```

Finally we need to explicitly make the insert box void.

```
566 {\setbox \@tempboxa \box \@kludgeins}% 567 \*trace\ 568 \fl@trace {kludgeins box made void}% 569 \/trace\ 570 } 571 \/2ekernel | fltrace\
```

\@texttop \@textbottom These do nothing as a default.

589 \endgroup
```

\@outputpage \@shipoutsetup \@writesetup The \color@hbox hooks here are used to avoid putting just a colour special into an otherwise empty box (in a header or footer). These boxes are often set to be completely empty and so adding a special produces a very underfull box message.

There has been extensive tidying up of the old code here; including the removal of a level of grouping.

The setting of \protect immediately before the \shipout is needed so that protected commands within \writes are handled correctly.

Within shipout's vbox it is reset to its default value, \relax.

Resetting it to its default value after the shipout has been completed (and the contents of the writes have been expanded) must be done by use of \aftergroup. This is because it must have the value \relax before macros coming from other uses of \aftergroup within this box are expanded.

Putting this into the **\aftergroup** token list does not affect the definition used in expanding the **\writes** because the aftergroup token list is only constructed when popping the save-stack, it is not expanded until after the shipout is completed.

Question: should things from an \aftergroup within the shipped out box be executed in the environment set up for the writes, or after it finishes?

A lot of this code has been in-lined to prevent mis-use of internal commands as hooks.

```
590 (/2ekernel)
```

591 (latexrelease)\IncludeInRelease{2017/03/10}%

592 (latexrelease) {\@outputpage}{Reset language for hyphenation}%

593 (\*2ekernel | latexrelease)

594 \def\@outputpage{%

The \endgroup is put in by \aftergroup.

595 \begingroup

Now all the set-up stuff has been in-lined for Frank.

First the stuff for the writes.

From here ... was in the command \@writesetup.

596 \let \protect \noexpand

RmS 93/08/19: Redefined accents to allow changes in font encoding; but exactly why was this needed?

Reset \language to the value current at \begin{document}. In particular this ensures that a pagebreak in verbatim does not prevent hyphenation in the page head.

## 597 \language\document@default@language

The \catcode'\ = 10 was removed as it was considered useless (presumably because nothing gets tokenised during shipout).

This was put in as some error produced active spaces in a mark, I think.

Why was the hyphen reset?

598 \@resetactivechars

If a page break happens between the start of a list and its first item the **@newlist** will be true and this will mess up any list that is used in the header or footer of the page. So we have to reset that flag.

```
\global\let\@@if@newlist\if@newlist
     \global\@newlistfalse
   This next hook replaces the following:
      \let\-\@dischyph
      \let\'\@acci\let\'\@accii\let\=\@acciii
      \let\\\@normalcr
      \ensuremath{\texttt{let}} 25 Sep 87 (this was once inside the box)
and it does more than they did; in particular it sets:
      \parindent\z@
      \parskip\z@skip
      \everypar{}%
      \leftskip\z@skip
      \rightskip\z@skip

                  708 (*2ekernel)
                  This unboxes stuff that must appear before anything else in the .dvi file, then
     \@begindvi
                  returns that box register to the free list and cancels itself.
                     The stuff in the box should not add any typeset material to the page.
                  709 \def \@begindvi{%
                       \unvbox \@begindvibox

## CHANGE TO \@addtocurcol:

\penalty\z@ changed to \penalty\interlinepenalty so \samepage works properly with figure and table environments. (Changed 23 Oct 86)

There is also an \addpenalty\interlinepenalty above.

Since in 2e \samepage is no longer supported, these could be removed.

Although it is best to use \addvspace in case two h floats come together, this makes other spacing more difficult to adjust; whereas if a user specifies two h floats together then they can more easily get the spacing correct by ad hoc commands.

It is necessary to adjust for the addition of \parskip here in case the float is added between paragraphs (i.e. when in vertical mode).

If the nobreak switch is true we need to reset it and clear \everypar since the float may not reset the flag and cannot reset the \everypar globally.

Typesetting starts here (we are in vertical mode).

```
\if@nobreak

                                           \@flsettextmin
This is a new adjustment which is quite a major change in functionality; but it
implements the documentation. Note that \@reqcolroom will include the whole
of the page-so-far, and hence includes \Otextfloatsheight of floats, so before
comparing it with \@textmin, we add this to \@textmin also.

File K: ltoutput.dtx Date: 2017/04/11 Version v1.4a

#### CHANGE TO \@addtocurcol:

\penalty\z@ changed to \penalty\interlinepenalty so \samepage works properly with figure and table environments. (Changed 23 Oct 86)

There is also an \addpenalty\interlinepenalty above.

Since in 2e \samepage is no longer supported, these could be removed.

Although it is best to use \addvspace in case two h floats come together, this makes other spacing more difficult to adjust; whereas if a user specifies two h floats together then they can more easily get the spacing correct by ad hoc commands.

It is necessary to adjust for the addition of \parskip here in case the float is added between paragraphs (i.e. when in vertical mode).

If the nobreak switch is true we need to reset it and clear \everypar since the float may not reset the flag and cannot reset the \everypar globally.

Typesetting starts here (we are in vertical mode).

```

# 65.1.1 Kludgeins

This part of the file is part of the implementation of the following two new commands for  $\LaTeX$  22e.

\enlargethispage{<dim>}

Adds <dim> to the height of the current column only. On the printed page the bottom of this column is extended downwards by exactly <dim> without having any effect on the placement of the footer; this may result in an overprinting.

```
\enlargethispage*{<dim>}
```

Similar to \enlargethispage but it tries to squeeze the column to be printed in as small a space as possible, ie it uses any shrinkability in the column. If the column was not explicitly broken (e.g. with \pagebreak) this may result in an overfull box message but execpt for this it will come out as expected (if you know what to expect).

The star form of this command is dedicated to Leslie Lamport, the other we need for ourselves (FMi, CAR).

These commands may well have unwanted effects if used soon before a **\clearpage**: please give keep them clear of such places.

\@kludgeins

The insert which makes TEX do a lot of the necessary work. All we need to put into it is the amount by which the pagegoal should be changed.

```
1851 \newinsert \@kludgeins
1852 \global\dimen\@kludgeins \maxdimen
1853 \global\count\@kludgeins 1000
```

\enlargethispage \enlargethispage\* The user command.

```
1854 \gdef \enlargethispage {%

### 65.1.2 Float control

This part implements controllable floats and other changes to the float mechanism. It provides, at the document level, the following command for inclusion in ĿTEX2e.

\suppressfloats

This suppresses all further floats on the current page.

With an optional argument it suppresses only floats only in certain positions on the current page.

suppresses only floats at the top of the page [b] only floats at the bottom of the page

It also enables the use of an extra specifier, !, in the location optional argument of a float. If this is present then, just for this particular float, whenever it is processed by the float mechanism the followinhg are ignored:

- all restrictions on the number of floats which can appear;
- all explicit restrictions on the amount of space which should (not) be occupied by floats and/or text.

The mechanism will still attempt to ensure that pages are not overfull.

These specifiers override, for the single float, the suppression commands described above.

In its current form, it also supplies a reasonably exhaustive, and somewhat baroque, means of tracing some aspects of the float mechanism.

453

More tracing.

```
Set-up tracing for floats independent of other tracing as it produces mega-output.
       \fl@trace
                   Default is no tracing.

\fl@trace{botlist: \@botlist}%

Manipulation of float placement and type; both their strings and the corresponding count registers.

First a new count register to go with \@currtype. Then a new skip register, for information needed to remove the \@maxsep \@reqcolroom \@textfloatsheight conservatism: it is possible that this could use a temporary register. Finally a dimension register to hold the total height of in-text floats on the current page. This is needed to implement a major change in the functionality of \@addtocurcol which is, nevertheless, a bug fix. It is not local and therefore cannot be a temporary register. 1985 \newcount \@fpstype 1986 \newdimen \@reqcolroom 1987 \newdimen \@textfloatsheight 1988 (/2ekernel) \@fpsadddefault Adds the default placement to what is already there. Special stuff for BANG floats.

\@flsetnum Ig

Ignores any zero float counter value in case BANG.

It uses a local assignment to the normally global counter: a bit naughty, perhaps?

These assignments are safe so long as the counter involved is only consulted once (i.e. only for the 'bang float') with the changed value. This is the case within \@addtocurcol because it is used only once within a call of the output routine (which forms a group).

For \@addtonextcol this is achieved by putting a group around its code; this is needed because it is called (by \@startcolumn) for each float which was on the deferlist. Almost identical considerations pertain to \@addtodblcol. There may be more efficient ways to handle this, but the group seems to be the simplest.

```

Interesting facts about float mechanisms past and present, together with a summary of various features, some unresolved:

- 1. The value \textfraction does not affect the processing of doublecol floats: this seems sensible, but should be documented.
- 2. \twocolumn floatplacement was wrong: dbl not needed, ord needed.
- 3. \Offloatplacement was not called after \Ostartdblcol or \Otopnewpage. This has been changed; it is clearly a bug fix.
- 4. The use \@topnewpage when \dblfigrule is non-trivial produced a rule in the wrong place. This has been fixed by not using \dblfigrule when processing the 'float' from \@topnewpage.
- 5. If the specifier was just h and the float could not be put here, it went on the deferlist and stayed there until a clearpage. It now gets changed to a 'th': this is only an error-recovery action, putting just h or !h should be deprecated.
- 6. \@dblmaxsep was 'the maximum of \dblfloatsep and \dbltexfloatsep'. But it was never used! Now gone completely, like \@maxsep.
- 7. After an h float is put on a page, it was counted as text when applying the \textfraction test; this is possibly too big a change although it is a bug fix?
- 8. Two consecutive h floats are separated by twice \intextsep: this could be changed to one by use of \addvspace, OK? Note that it would also mean that less space is put in if an h float immediately follows other spaces. This is also possibly too big a change, at least for compatibility mode? Or it may be simply wrong! It has not been changed.

- 9. Now \Qaddtocurcol checks first for just p fps. I think that this is an increase in efficiency, but maybe the coding should be made even more efficient.
- 10. \@tryfcolumn now tests if the list is empty first, otherwise lots of wasted time! Thus this test has been removed from \@startcolumn. As Frank pointed out, this makes \@startcolumn less efficient. But it is now the same as \@startdblcolumn: I can see no reason why they should be different, but which is best?
- 11. Why is \@colroom set in \@doclearpage?
- 12. Footnotes. Check what \clearpage does when footnotes are left over. Footnotes are not put on float pages and, also, \@addtonextcol ignores the existence of held-over footnotes in deciding what floats can go on the page. Not changed.
- 13. \clearpage can still lose non-boxes, at least when floats are involved. It also moves some to the 'wrong page', but this may be a coding problem.
- 14. The ! option makes it necessary to check in \output that there is enough room left on the page after adding a float. (This would have been necessary anyway if anyone set \@textmin too close to zero! A similar danger existed also if the text in a \twocolumn[text] entity gets too large.) The current implementation of this also makes the normal case a little less efficient, OK? Not enough room means, at present, less than \baselineskip, with a warning: is this OK? Should it be made generic (another parameter)?
- 15. There are four possibilities for supporting this:

#### \twocolumn[\maketitle more text]

One is to change \maketitle slightly to allow this. Another is to change \@topnewpage so that more than one \twocolumn[] command is allowed; in this case \maketitle\twocolumn[more text] will work. The former is more robust from the user's viewpoint, but makes the code for \maketitle rather ad hoc (maybe it is already?). Another is to misuse the global twocolumn flag locally within \@topnewpage. Yet another is to move the column count register from the multicol package into the kernel. This has been done.

- 16. Where should the reinserts be put to maximise the probability that footmotes come out on the correct page? Or should we go for as much compatibility as possible (but see next item)?
- 17. Should we continue to support (as much as possible) \samepage? Some of its intended functionality is now advertised as being provided by \enlargethispage. Use of either is likely to result in wrongly placed footnotes, marginals, etc. Which should have priority: obeying the pagination instructions, or correct placement of notes/marginalia?
- 18. Is the adjustment of space to cause shrinking in the kludge-\* case correct? Should it be limited to 0pt?
- 19. Is the setting of \boxmaxdepth in makecol and friends needed? It only has any effect if \@textbottom ends with a box or rule, in which case the vskip

to allow for its depth should also be added. If it is kept, it should probably be the last thing in the box. It has now been removed.

It would perhaps be better to document that \@textbottom and \@texttop must have natural height 0pt.

- 20. I cannot see why the vskip adjustment for the depth is needed if box-maxdepth is used to ensure that there is never a too deep box.
- 21. The value of \boxmaxdepth should be explicitly set whenever necessary: it is too risky to assume that it has any particular value. Care is needed in deciding what to set it to.

It is interesting to note that the value of \boxmaxdepth is unique in being read before the local settings for the box group are reset; all other parameter settings which affect the box construction use their values outside the box group.

22. Should \@maxdepth store the setting of \maxdepth from lplain? Or should we provide a proper interface to class files for setting these?

An analysis of various other macros.

\@opcol should do \@floatplacement, but where? Right at the end, since it always occurs at the start of a column.

```
\def\@opcol{%
  % Why is this done first?
  \global \@mparbottom \z@
  \if@twocolumn
    \@outputdblcol
  \else
    \@outputpage
    % This is not needed since it is done at the end of
    %    |\@outputpage|:
    \global \@colht \textheight
  \fi}
```

Only tracing has been added to these.

#### 65.1.3 Float placement parameters

The main purpose of this section is to ensure that all the float-placement parameters which need to be set in a class file or package have been declared. It also describes their use and sets values for them which are reasonable for typical documents using US letter or A4 sized paper.

#### Limits for the placement of floating objects

\c@topnumber

This counter holds the maximum number of floats that can appear at the top of a text page or column.

```
2287 (*2ekernel)
2288 \newcount\c@topnumber
2289 \setcounter{topnumber}{2}
```

\topfraction This macro holds the maximum proportion (as a decimal number) of a text page or column that can be occupied by floats at the top.

2290 \newcommand\topfraction{.7}

\c@bottomnumber

This counter holds the maximum number of floats that can appear at the bottom of a text page or column.

2291 \newcount\c@bottomnumber 2292 \setcounter{bottomnumber}{1}

\bottomfraction This macro holds the maximum proportion (as a decimal number) of a text page or column that can be occupied by floats at the bottom.

2293 \newcommand\bottomfraction{.3}

\c@totalnumber

This counter holds the maximum number of floats that can appear on any text page or column.

2294 \newcount\c@totalnumber 2295 \setcounter{totalnumber}{3}

\textfraction

This macro holds the minimum proportion (as a decimal number) of a text page or column that must be occupied by text.

2296 \newcommand\textfraction{.2}

\floatpagefraction

This macro holds the minimum proportion (as a decimal number) of a page or column that must be occupied by floating objects before a 'float page' is produced.

2297 \newcommand\floatpagefraction{.5}

\c@dbltopnumber

This counter holds the maximum number of double-column floats that can appear on the top of a two-column text page.

2298 \newcount\c@dbltopnumber 2299 \setcounter{dbltopnumber}{2}

\dbltopfraction This macro holds the maximum proportion (as a decimal number) of a two-column text page that can be occupied by double-column floats at the top.

2300 \newcommand\dbltopfraction{.7}

\dblfloatpagefraction

This macro holds the minimum proportion (as a decimal number) of a page that must be occupied by double-column floating objects before a 'double-column float page' is produced.

2301 \newcommand\dblfloatpagefraction{.5}

#### Floats on a text page

\floatsep \textfloatsep \intextsep

When a floating object is placed on a page with text, these parameters control the separation between the float and the other objects on the page. These parameters are used for both one-column mode and single-column floats in two-column mode. They are all rubber lengths.

\floatsep is the space between adjacent floats that are placed at the top or bottom of the text page or column.

\textfloatsep is the space between the main text and floats at the top or bottom of the page or column.

\intextsep is the space between in-text floats and the text.

```
2302 \newskip\floatsep
2303 \newskip\textfloatsep
2304 \newskip\intextsep
2305 \setlength\floatsep {12\p@ \@plus 2\p@ \@minus 2\p@}
2306 \setlength\textfloatsep{20\p@ \@plus 2\p@ \@minus 4\p@}
2307 \setlength\intextsep {12\p@ \@plus 2\p@ \@minus 2\p@}
```

\dblfloatsep \dbltextfloatsep

When double-column floats (floating objects that span the whole \textwidth) are placed at the top of a text page in two-column mode, the separation between the float and the text is controlled by \dblfloatsep and \dbltextfloatsep. They are rubber lengths.

\dblfloatsep is the space between adjacent double-column floats placed at the top of the text page.

\dbltextfloatsep is the space between the main text and double-column floats at the top of the page.

#### Floats on their own page or column

\@fptop
\@fpsep
\@fpbot

When floating objects are placed on a separate page or column, called a 'float page', the layout of the page is controlled by these parameters, which are rubber lengths.

At the top of the page \@fptop is inserted; typically this supplies some stretchable whitespace. At the bottom of the page \@fpbot ais inserted. Between adjacent floats \@fpsep is inserted.

These parameters are used for all floating objects on a 'float page' in one-column mode, and for single-column floats in two-column mode.

Note that at least one of the two parameters \@fptop and \@fpbot should contain a plus ...fil so as to fill the remaining empty space.

```
2312 \newskip\@fptop
2313 \newskip\@fpsep
2314 \newskip\@fpbot
2315 \setlength\@fptop{0\p@ \@plus 1fil}
2316 \setlength\@fpsep{8\p@ \@plus 2fil}
2317 \setlength\@fpbot{0\p@ \@plus 1fil}

\@dblfptop Double-column 'float pages' in two-column mode use similar parameters.
\@dblfpsep
2318 \newskip\@dblfptop
\@dblfpbot 2319 \newskip\@dblfpsep
2320 \newskip\@dblfpbot
2321 \setlength\@dblfptop{0\p@ \@plus 1fil}
2322 \setlength\@dblfpsep{8\p@ \@plus 2fil}
2323 \setlength\@dblfpbot{0\p@ \@plus 1fil}
```

\topfigrule The macros can be used to put in rules between floats and text; whatever they \botfigrule insert should be vertical mode material which takes up zero space.

```
\label{eq:continuity} $$ \del{continuity} $$ 2324 \left\  \right ] $$ 2325 \left\  \right ] $$ 2325 \left\  \right ] $$ 2326 \left\  \right ] $$ 2326 \left\  \right ] $$ 2327 \left\  \right ] $$ 2327 \left\  \right ] $$
```

#### File L

# ltclass.dtx

#### 66 Introduction

This file implements the following declarations, which replace \documentstyle in LATEX  $2\varepsilon$  documents.

Note that old documents containing \documentstyle will be run using a compatibility option—thus keeping everyone happy, we hope!

The overall idea is that there are two types of 'style files': 'class files' which define elements and provide a default formatting for them; and 'packages' which provide extra functionality. One difference between LATEX  $2_{\varepsilon}$  and LATEX  $2_{\varepsilon}$  and LATEX  $2_{\varepsilon}$  packages may have options. Note that options to classes packages may be implemented such that they input files, but these file names are not necessarily directly related to the option name.

#### 67 User interface

 $\documentclass[\langle main-option-list \rangle] \{\langle class \rangle\} [\langle version \rangle]$ 

There must be exactly one such declaration, and it must come first. The  $\langle main\text{-}option\text{-}list \rangle$  is a list of options which can modify the formatting of elements which are defined in the  $\langle class \rangle$  file as well as in all following \usepackage declarations (see below). The  $\langle version \rangle$  is a version number, beginning with a date in the format YYYY/MM/DD. If an older version of the class is found, a warning is issued.

 $\documentstyle[\langle main-option-list\rangle] \{\langle class\rangle\}[\langle version\rangle]$ 

The \documentstyle declaration is kept in order to maintain upward compatibility with LATEX2.09 documents. It is similar to \documentclass, but it causes all options in \( \frac{main-option-list} \) that the \( \class \) does not use to be passed to \RequirePackage after the options have been processed. This maintains compatibility with the 2.09 behaviour. Also a flag is set to indicate that the document is to be processed in LATEX2.09 compatibility mode. As far as most packages are concerned, this only affects the warnings and errors LATEX generates. This flag does affect the definition of font commands, and \sloppy.

 $\verb|\usepackage| [\langle package-option-list\rangle] | \{\langle package-list\rangle\} | \{\langle version\rangle\}|$ 

There can be any number of these declarations. All packages in  $\langle package\text{-}list \rangle$  are called with the same options.

Each  $\langle package \rangle$  file defines new elements (or modifies those defined in the  $\langle class \rangle$ ), and thus extends the range of documents which can be processed. The  $\langle package\text{-}option\text{-}list \rangle$  is a list of options which can modify the formatting of elements defined in the  $\langle package \rangle$  file. The  $\langle version \rangle$  is a version number, beginning with a date in the format YYYY/MM/DD. If an older version of the package is found, a warning is issued.

Each package is loaded only once. If the same package is requested more than once, nothing happens, unless the package has been requested with options that were not given the first time it was loaded, in which case an error is produced.

As well as processing the options given in the  $\langle package\text{-}option\text{-}list \rangle$ , each package processes the  $\langle main\text{-}option\text{-}list \rangle$ . This means that options that affect all of the packages can be given globally, rather than repeated for every package.

filecontents

Note that class files have the extension .cls, packages have the extension .sty. The environment filecontents is intended for passing the contents of packages, options, or other files along with a document in a single file. It has one argument, which is the name of the file to create. If that file already exists (maybe only in the current directory if the OS supports a notion of a 'current directory' or 'default directory') then nothing happens (except for an information message) and the body of the environment is bypassed. Otherwise, the body of the environment is written verbatim to the file name given as the first argument, together with some comments about how it was produced.

The environment is allowed only before \documentclass to ensure that all packages or options necessary for this particular run are present when needed. The begin and end tags should each be on a line by itself. There is also a star-form; this does not write extra comments into the file.

#### 67.1 Option processing

When the options are processed, they are divided into two types: local and global:

- For a class, the options in the \documentclass command are local.
- For a package, the options in the \usepackage command are local, and the options in the \documentclass command are global.

The options for \documentclass and \usepackage are processed in the following way:

- 1. The local and global options that have been declared (using \DeclareOption as described below) are processed first.
  - In the case of \ProcessOptions, they are processed in the order that they were declared in the class or package.
  - In the case of \ProcessOptions\*, they are processed in the order that they appear in the option-lists. First the global options, and then the local ones.
- 2. Any remaining local options are dealt with using the default option (declared using the \DeclareOption\* declaration described below). For document classes, this usually does nothing, but records the option on a list of unused options. For packages, this usually produces an error.

Finally, when \begin{document} is reached, if there are any global options which have not been used by either the class or any package, the system will produce a warning.

# 68 Class and Package interface

#### 68.1 Class name and version

\ProvidesClass

A class can identify itself with the  $\ProvidesClass\{\langle name \rangle\}[\langle version \rangle]$  command. The  $\langle version \rangle$  should begin with a date in the format YYYY/MM/DD.

### 68.2 Package name and version

\ProvidesPackage

A package can identify itself with the  $\ProvidesPackage{\langle name \rangle}[\langle version \rangle]$  command. The  $\langle version \rangle$  should begin with a date in the format YYYY/MM/DD.

#### 68.3 Requiring other packages

\RequirePackage

Packages or classes can load other packages using

 $\RequirePackage[\langle options \rangle] \{\langle name \rangle\} [\langle version \rangle].$ 

If the package has already been loaded, then nothing happens unless the requested options are not a subset of the options with which it was loaded, in which case an error is called.

\LoadClass \PassOptionsToPackage Similar to \RequirePackage, but for classes, may not be used in package files.

Packages can pass options to other packages using:

 $\label{lem:passOptionsToPackage} $$\operatorname{Options} {\ \langle package \rangle \}.$}$ 

\PassOptionsToClass

This adds the  $\langle options \rangle$  to the options list of any future \RequirePackage or \usepackage command. For example:

```
\PassOptionsToPackage{foo,bar}{fred}
\RequirePackage[baz]{fred}
```

is the same as:

\RequirePackage[foo,bar,baz]{fred}

\LoadClassWithOptions

\RequirePackageWithOptions

 $\verb|\LoadClassWithOptions{|} \langle name \rangle | [\langle version \rangle] :$ 

This is similar to  $\LoadClass$ , but it always calls class  $\langle name \rangle$  with exactly the same option list that is being used by the current class, rather than an option explicitly supplied or passed on by  $\LoadClass$ .  $\RequirePackageWithOptions$  is the analogous command for packages.

This is mainly intended to allow one class to simply build on another, for example:

\LoadClassWithOptions{article}

This should be contrasted with the slightly different construction

```
\DeclareOption*{\PassOptionsToClass{\CurrentOption}{article}}
\ProcessOptions
\LoadClass{article}
```

As used here, the effects are more or less the same, but the version using \LoadClassWithOptions is slightly quicker (and less to type). If, however, the class declares options of its own then the two constructions are different; compare, for example:

```
\DeclareOption{landscape}{...}
\ProcessOptions
\LoadClassWithOptions{article}
```

with:

```
\DeclareOption{landscape}{...}
\DeclareOption*{\PassOptionsToClass{\CurrentOption}{article}}
\ProcessOptions
\LoadClass{article}
```

File L: ltclass.dtx Date: 2017/03/08 Version v1.2c

In the first case, the article class will be called with option landscape precisely when the current class is called with this option; but in the second example it will not as in that case article is only passed options by the default option handler, which is not used for landscape as that option is explicitly declared.

\@ifpackageloaded
 \@ifclassloaded
 \@ifpackagelater

To find out if a package has already been loaded, use  $\ensuremath{\mbox{\sc Gifpackageloaded}} \{\langle package \rangle\} \{\langle true \rangle\} \{\langle false \rangle\}.$ 

To find out if a package has already been loaded with a version equal to or more recent than  $\langle version \rangle$ , use

\@ifclasslater
\@ifpackagewith
\@ifclasswith

\DeclareOption

\DeclareOption\*

 $\ensuremath{\mbox{\tt Qifpackage}} \{\langle version \rangle\} \{\langle true \rangle\} \{\langle false \rangle\}.$ 

There exists one package that can't be tested with the above commands: the fontenc package pretends that it was never loaded to allow for repeated reloading with different options (see ltoutenc.dtx for details).

#### 68.4 Declaring new options

Options for classes and packages are built using the same macros.

To define a builtin option, use  $\DeclareOption\{\langle name \rangle\}\{\langle code \rangle\}$ .

To define the default action to perform for local options which have not been declared, use  $\ensuremath{\texttt{DeclareOption*}\{\langle code \rangle\}}$ .

Note: there should be no use of

\RequirePackage, \DeclareOption, \DeclareOption\* or \ProcessOptions inside \DeclareOption or \DeclareOption\*.

Possible uses for \DeclareOption\* include:

\DeclareOption\*{}

Do nothing. Silently accept unknown options. (This suppresses the usual warnings.)

\DeclareOption\*{\@unkownoptionerror}

Complain about unknown local options. (The initial setting for package files.)

\DeclareOption\*{\PassOptionsToPackage{\CurrentOption}{ $\langle pkg-name \rangle$ } Handle the the current option by passing it on to the package  $\langle pkg-name \rangle$ , which will presumably be loaded via \RequirePackage later in the file. This is useful for building 'extension' packages, that perhaps handle a couple of new options, but then pass everything else on to an existing package.

\DeclareOption\*{\InputIfFileExists{xx-\CurrentOption.yyy}% {}%

{\OptionNotUsed}}

Handle the option foo by loading the file xx-foo.yyy if it exists, otherwise do nothing, but declare that the option was not used. Actually the \OptionNotUsed declaration is only needed if this is being used in class files, but does no harm in package files.

#### 68.5 Safe Input Macros

\InputIfFileExists

 $\label{linearists} $$ \prod_{e \in \mathcal{E}(file)} {\langle then \rangle} {\langle else \rangle} $$$ 

Inputs  $\langle file \rangle$  if it exists. Immediately before the input,  $\langle then \rangle$  is executed. Otherwise  $\langle else \rangle$  is executed.

\IfFileExists

As above, but does not input the file.

One thing you might like to put in the  $\langle else \rangle$  clause is

\@missingfileerror

This starts an interactive request for a filename, supplying default extensions. Just hitting return causes the whole input to be skipped and entering x quits the current run.

\input

This has been redefined from the LATEX2.09 definition, in terms of the new commands \InputIfFileExists and \@missingfileerror.

\listfiles

Giving this declaration in the preamble causes a list of all files input via the 'safe input' commands to be listed at the end. Any strings specified in the optional argument to \ProvidesPackage are listed alongside the file name. So files in standard (and other non-standard) distributions can put informative strings in this argument.

#### 69 Implementation

 $_1$   $\langle *2ekernel \rangle$ 

\if@compatibility The flag for compatibility mode.

2 \newif\if@compatibility

\@documentclasshook The hook called after the first \documentclass command. By default this checks to see if \Onormalsize is undefined, and if so, sets it to \normalsize.

3 \def\@documentclasshook{%

\ifx\@normalsize\@undefined

5 \let\@normalsize\normalsize

6 \fi

7 }

\@declaredoptions

This list is automatically built by \DeclareOption. It is the list of options (separated by commas) declared in the class or package file and it defines the order in which the the corresponding \ds@(option) commands are executed. All local (option)s which are not declared will be processed in the order defined by the optional argument of \documentclass or \usepackage.

8 \let\@declaredoptions\@empty

\@classoptionslist List of options of the main class.

9 \let\@classoptionslist\relax

10 \@onlypreamble\@classoptionslist

\@unusedoptionlist List of options of the main class that haven't been declared or loaded as class option files.

11 \let\@unusedoptionlist\@empty

12 \@onlypreamble\@unusedoptionlist

\CurrentOption Name of current package or option.

13 \let\CurrentOption\@empty

\@currname Name of current package or option.

14 \let\@currname\@empty

\@currext The current file extension.

15 \global\let\@currext=\@empty

```
\@clsextension The two possible values of \@currext.
   \@pkgextension
                     16 \def\@clsextension{cls}
                     17 \def\@pkgextension{sty}
                     18 \@onlypreamble\@clsextension
                     19 \@onlypreamble\@pkgextension
   \@pushfilename
                    Commands to push and pop the file name and extension.
                    #1 current name.
    \@popfilename
  \@currnamestack #2 current extension.
                    #3 current catcode of Q.
                    #4 Rest of the stack.
                     20 \def\@pushfilename{%
                         \xdef\@currnamestack{%
                     21
                            {\@currname}%
                     22
                            {\@currext}%
                     23
                            {\the\catcode'\@}%
                     24
                            \@currnamestack}}

179 \fi}
180 \Conlypreamble\OptionNotUsed
```

\default@ds

The default default option code. Set by \@onefilewithoptions to either \OptionNotUsed for classes, or \@unknownoptionerror for packages. This may be reset in either case with \DeclareOption\*.

181 % \let\default@ds\OptionNotUsed

\ProcessOptions \ProcessOptions\*

\ProcessOptions calls \ds@option for each known package option, then calls \default@ds for each option on the local options list. Finally resets all the declared options to \relax. The empty option does nothing, this has to be reset on the off chance it's set to \relax if an empty element gets into the \@declaredoptions list.

The star form is similar but executes options given in the order specified in the document, not the order they are declared in the file. In the case of packages, global options are executed before local ones.

```

Then we do some work.

First of all, we define the global variables. Then we look to see if the file has already been loaded. If it has, we check that it was first loaded with at least the current options. If it has not, we add the current options to the package options, set the default version to be 0000/00/00, and load the file if we can find it. Then we check the version number.

Finally, we restore the old file name, reset the default option, and we set the catcode of Q.

For classes, we can immediately process the file. For other types, #2 could be a comma separated list, so loop through, processing each one separately.

#### 69.1 Hooks

\@begindocumenthook

Allow code do be saved to be executed at specific later times.

Stuff to appear at the beginning or end of the document.

Save things in macros, I considered using toks registers, (and **\addto@hook** from the NFSS code, that would require stacking the contents in the case of required packages, so just generate a new macro for each package.

```
\@enddocumenthook
                     454 \ifx\@begindocumenthook\@undefined
                      455

#### 70 After Preamble

Finally we declare a package that allows all the commands declared above to be \@onlypreamble to be used after \begin{document}.

#### File M

# lthyphen.dtx

This file contains the code for loading hyphenation patterns into IATEX. Most of this will end up in a file called hyphen.ltx. If you wish to customize your IATEX system in respect of hyphenation patterns, write a file hyphen.cfg. If this file exists, it will be loaded instead of hyphen.ltx. See the comments below for additional information.

To produce the printed version of this file the following code is used. It can be extracted with the DOCSTRIP program, or one can run this file directly through  $\LaTeX$ 

```
1 (*driver)
2 \documentclass{ltxdoc}
3 \begin{document}
4 \DocInput{lthyphen.dtx}
5 \end{document}
6 (/driver)
```

The default file hyphen.ltx loads hyphenation patterns for US english. If you want to load additional or other hyphenation patterns, you should create a file hyphen.cfg. This is best done by starting from hyphen.ltx.

For backward compatibility, the default file, hyphen.ltx, first tries to load the file hyphen.tex. If this file exists, an information message is issued and the appropriate defaults for TEX's internal parameters are set: \language is initialized to 0, and \lefthyphenmin and \righthyphenmin to 2 and 3, respectively, to disallow x- or -xx breaks.

```
7 (*default)
8 \InputIfFileExists{hyphen.tex}%
9 {\message{Loading hyphenation patterns for US english.}%
10 \language=0
11 \lefthyphenmin=2 \righthyphenmin=3 }%
```

Otherwise, since we cannot do anything without any hyphenation patterns, an error message is printed and the IniT<sub>E</sub>X run is terminated by invoking \@@end (which is the LaT<sub>E</sub>X  $2_{\varepsilon}$  name for T<sub>E</sub>X's \end primitive).

The following example describes the possible contents of a file hyphen.cfg that will load both US English and German hyphenation patterns, making the former the default. It sets \language to 0 for the US patterns and to 1 for the German patterns. Then \language is set to 0 to make this the default and the default values of \lefthyphenmin and \righthyphenmin are set.

```
\language=0 \input hyphen % (or \input ushyphen1 if the file has been renamed)
```

\language=1 \input ghyph31 \language=0 \lefthyphenmin=2 \righthyphenmin=3 \endinput

Another possibility is to use the package babel, by Johannes Braams. That package is distributed with a suitable hyphen.cfg file.

#### File N

## ltluatex.dtx

#### 71 Overview

LuaTEX adds a number of engine-specific functions to TEX. Several of these require set up that is best done in the kernel or need related support functions. This file provides basic support for LuaTEX at the LaTEX  $2\varepsilon$  kernel level plus as a loadable file which can be used with plain TEX and LaTEX.

This file contains code for both TEX (to be stored as part of the format) and Lua (to be loaded at the start of each job). In the Lua code, the kernel uses the namespace luatexbase.

The following \count registers are used here for register allocation:

\e@alloc@attribute@count Attributes (default 258)

\e@alloc@ccodetable@count Category code tables (default 259)

\e@alloc@luafunction@count Lua functions (default 260)

\e@alloc@whatsit@count User whatsits (default 261)

\e@alloc@bytecode@count Lua bytecodes (default 262)

\e@alloc@luachunk@count Lua chunks (default 263)

(\count 256 is used for \newMarks allocation and \count 257 is used for \newXeTeXintercharclass with XeTeX, with code defined in ltfinal.dtx). With any IATeX  $2_{\varepsilon}$  kernel from 2015 onward these registers are part of the block in the extended area reserved by the kernel (prior to 2015 the IATeX  $2_{\varepsilon}$  kernel did not provide any functionality for the extended allocation area).

# 72 Core T<sub>E</sub>X functionality

The commands defined here are defined for possible inclusion in a future LATEX format, however also extracted to the file ltluatex.tex which may be used with older LATEX formats, and with plain TEX.

\newattribute \newattribute $\{\langle attribute \rangle\}$ 

Defines a named \attribute, indexed from 1 (i.e. \attribute0 is never defined). Attributes initially have the marker value -"7FFFFFF ('unset') set by the engine.

Defines a named \catcodetable, indexed from 1 (\catcodetable0 is never assigned). A new catcode table will be populated with exactly those values assigned by IniT<sub>F</sub>X (as described in the LuaT<sub>F</sub>X manual).

Defines a named \luafunction, indexed from 1. (Lua indexes tables from 1 so \luafunction0 is not available).

\newwhatsit \newwhatsit $\{\langle whatsit \rangle\}$ 

Defines a custom \whatsit, indexed from 1.

File N: ltluatex.dtx

Allocates a number for Lua bytecode register, indexed from 1.

\newluachunkname

 $newluachunkname\{\langle chunkname \rangle\}$ 

Allocates a number for Lua chunk register, indexed from 1. Also enters the name of the regiser (without backslash) into the lua.name table to be used in stack traces

\catcodetable@initex \catcodetable@string \catcodetable@latex Predefined category code tables with the obvious assignments. Note that the latex and atletter tables set the full Unicode range to the codes predefined by the kernel.

\catcodetable@atletter

 $\stattribute{\langle attribute \rangle} {\langle value \rangle}$ 

\setattribute

 $\unsetattribute{\langle attribute \rangle}$ 

\unsetattribute

Set and unset attributes in a manner analogous to \setlength. Note that attributes take a marker value when unset so this operation is distinct from setting the value to zero.

### 73 Plain T<sub>E</sub>X interface

The Itluatex interface may be used with plain TEX using \input{ltluatex}. This inputs ltluatex.tex which inputs etex.src (or etex.sty if used with IATEX) if it is not already input, and then defines some internal commands to allow the Itluatex interface to be defined.

The luatexbase package interface may also be used in plain TEX, as before, by inputting the package \input luatexbase.sty. The new version of luatexbase is based on this ltluatex code but implements a compatibility layer providing the interface of the original package.

### 74 Lua functionality

#### 74.1 Allocators in Lua

new\_attribute

 $luatexbase.new_attribute(\langle attribute \rangle)$ 

Returns an allocation number for the  $\langle attribute \rangle$ , indexed from 1. The attribute will be initialised with the marker value -"7FFFFFFF ('unset'). The attribute allocation sequence is shared with the TeX code but this function does not define a token using \attributedef. The attribute name is recorded in the attributes table. A metatable is provided so that the table syntax can be used consistently for attributes declared in TeX or Lua.

new\_whatsit

luatexbase.new\_whatsit( $\langle whatsit \rangle$ )

Returns an allocation number for the custom  $\langle whatsit \rangle$ , indexed from 1.

new\_bytecode

 $luatexbase.new_bytecode(\langle bytecode \rangle)$ 

Returns an allocation number for a bytecode register, indexed from 1. The optional  $\langle name \rangle$  argument is just used for logging.

new\_chunkname

luatexbase.new\_chunkname( $\langle chunkname \rangle$ )

Returns an allocation number for a Lua chunk name for use with  $\langle name \rangle$  argument is added to the lua.name array at that index.

These functions all require access to a named TEX count register to manage their allocations. The standard names are those defined above for access from

TeX, e.g. "e@alloc@attribute@count, but these can be adjusted by defining the variable \( \text{type} \) count\_name before loading ltluatex.lua, for example

```
local attribute_count_name = "attributetracker"
require("ltluatex")
```

would use a TEX \count (\countdef'd token) called attributetracker in place of "e@alloc@attribute@count.

### 74.2 Lua access to TeX register numbers

 ${\tt registernumber}$ 

luatexbase.registernumer( $\langle name \rangle$ )

Sometimes (notably in the case of Lua attributes) it is necessary to access a register by number that has been allocated by TeX. This package provides a function to look up the relevant number using LuaTeX's internal tables. After for example \newattribute\myattrib, \myattrib would be defined by (say) \myattrib=\attribute15. luatexbase.registernumer("myattrib") would then return the register number, 15 in this case. If the string passed as argument does not correspond to a token defined by \attributedef, \countdef or similar commands, the Lua value false is returned.

As an example, consider the input:

```
\typeout{#1: \expandafter\meaning\csname#1\endcsname^^J
\space\space\space
}}
\test{undefinedrubbish}
\test{space}
\test{hbox}
\test{@MM}
\test{@tempdima}
\test{@tempdimb}
\test{strutbox}
\test{sixt@@n}
\arraycolored myattr=12
\myattr=200
\test{myattr}
```

If the demonstration code is processed with LuaLATEX then the following would be produced in the log and terminal output.

```
undefinedrubbish: \relax
bad input
```

space: macro:->
 bad input
hbox: \hbox
 bad input

@MM: \mathchar"4E20
 20000
@tempdima: \dimen14
 14
@tempdimb: \dimen15
 15
strutbox: \char"B
 11
sixt@@n: \char"10
 16
myattr: \attribute12
 12

Notice how undefined commands, or commands unrelated to registers do not produce an error, just return false and so print bad input here. Note also that commands defined by \newbox work and return the number of the box register even though the actual command holding this number is a \chardef defined token (there is no \boxdef).

#### 74.3 Module utilities

provides\_module

 $luatexbase.provides_module(\langle info \rangle)$ 

This function is used by modules to identify themselves; the info should be a table containing information about the module. The required field name must contain the name of the module. It is recommended to provide a field date in the usual LATEX format yyyy/mm/dd. Optional fields version (a string) and description may be used if present. This information will be recorded in the log. Other fields are ignored.

module\_info
module\_warning
module\_error

luatexbase.module\_info( $\langle module \rangle, \langle text \rangle$ )
luatexbase.module\_warning( $\langle module \rangle, \langle text \rangle$ )

luatexbase.module\_error( $\langle module \rangle$ ,  $\langle text \rangle$ )

These functions are similar to LATEX's \PackageError, \PackageWarning and \PackageInfo in the way they format the output. No automatic line breaking is done, you may still use \n as usual for that, and the name of the package will be prepended to each output line.

Note that luatexbase.module\_error raises an actual Lua error with error(), which currently means a call stack will be dumped. While this may not look pretty, at least it provides useful information for tracking the error down.

#### 74.4 Callback management

add\_to\_callback

luatexbase.add\_to\_callback( $\langle callback \rangle$ ,  $\langle function \rangle$ ,  $\langle description \rangle$ ) Registers the  $\langle function \rangle$  into the  $\langle callback \rangle$  with a textual  $\langle description \rangle$  of the function. Functions are inserted into the callback in the order loaded.

 ${\tt remove\_from\_callback}$ 

luatexbase.remove\_from\_callback( $\langle callback \rangle$ ,  $\langle description \rangle$ ) Removes the callback function with  $\langle description \rangle$  from the  $\langle callback \rangle$ . The removed function and its description are returned as the results of this function.

 $in\_callback$ 

luatexbase.in\_callback( $\langle callback \rangle$ ,  $\langle description \rangle$ ) Checks if the  $\langle description \rangle$ 

File N: ltluatex.dtx

matches one of the functions added to the list for the  $\langle callback \rangle$ , returning a boolean value.

disable\_callback

luatexbase.disable\_callback( $\langle callback \rangle$ ) Sets the  $\langle callback \rangle$  to false as described in the LuaTeX manual for the underlying callback.register built-in. Callbacks will only be set to false (and thus be skipped entirely) if there are no functions registered using the callback.

callback\_descriptions

A list of the descriptions of functions registered to the specified callback is returned. {} is returned if there are no functions registered.

create\_callback

luatexbase.create\_callback( $\langle name \rangle$ ,metatype, $\langle default \rangle$ ) Defines a user defined callback. The last argument is a default function or false.

call\_callback

luatexbase.call\_callback( $\langle name \rangle$ ,...) Calls a user defined callback with the supplied arguments.

### 75 Implementation

```
1 \langle *2ekernel \mid tex \mid latexrelease \rangle
```

2 (2ekernel | latexrelease) \ifx\directlua\@undefined\else

#### 75.1 Minimum LuaT<sub>F</sub>X version

LuaTEX has changed a lot over time. In the kernel support for ancient versions is not provided: trying to build a format with a very old binary therefore gives some information in the log and loading stops. The cut-off selected here relates to the tree-searching behaviour of require(): from version 0.60, LuaTEX will correctly find Lua files in the texmf tree without 'help'.

### 75.2 Older LATEX/Plain TEX setup

```
11 (*tex)
```

Older LATEX formats don't have the primitives with 'native' names: sort that out. If they already exist this will still be safe.

```
12 \directlua{tex.enableprimitives("",tex.extraprimitives("luatex"))}
```

13 \ifx\e@alloc\@undefined

```
In pre-2014 LATEX, or plain TEX, load etex.{sty,src}.

14 \ifx\documentclass\@undefined
```

```
15 \ifx\loccount\@undefined
16 \input{etex.src}%
17 \fi
```

18 \catcode'\@=11 %

19 \outer\expandafter\def\csname newfam\endcsname
20 {\alloc@8\fam\chardef\et@xmaxfam}

21 \else

22 \RequirePackage{etex}

```
23 \expandafter\def\csname newfam\endcsname
24 {\alloc@8\fam\chardef\et@xmaxfam}
25 \expandafter\let\expandafter\new@mathgroup\csname newfam\endcsname
26 \fi
```

# 75.2.1 Fixes to etex.src/etex.sty

These could and probably should be made directly in an update to etex.src which already has some LuaTeX-specific code, but does not define the correct range for LuaTeX.

2015-07-13 higher range in luatex.

```
27 \edef \et@xmaxregs {\ifx\directlua\@undefined 32768\else 65536\fi} luatex/xetex also allow more math fam.
```

```
28 \edef \et@xmaxfam {\ifx\Umathchar\@undefined\sixt@@n\else\@cclvi\fi}
29 \count 270=\et@xmaxregs % locally allocates \count registers
30 \count 271=\et@xmaxregs % ditto for \dimen registers
31 \count 272=\et@xmaxregs % ditto for \skip registers
32 \count 273=\et@xmaxregs % ditto for \muskip registers
33 \count 274=\et@xmaxregs % ditto for \box registers
34 \count 275=\et@xmaxregs % ditto for \toks registers
35 \count 276=\et@xmaxregs % ditto for \marks classes
and 256 or 16 fam. (Done above due to plain/LATEX differences in Itluatex.)
```

36 % \outer\def\newfam{\alloc08\fam\chardef\et0xmaxfam}

End of proposed changes to etex.src

# 75.2.2 luatex specific settings

Switch to global cf luatex.sty to leave room for inserts not really needed for luatex but possibly most compatible with existing use.

```
37 \expandafter\let\csname newcount\expandafter\expandafter\endcsname
38 \csname globcount\endcsname
39 \expandafter\let\csname newdimen\expandafter\expandafter\endcsname
40 \csname globdimen\endcsname
41 \expandafter\let\csname newskip\expandafter\expandafter\endcsname
42 \csname globskip\endcsname
43 \expandafter\let\csname newbox\expandafter\expandafter\endcsname
44 \csname globbox\endcsname
```

Define\e@alloc as in latex (the existing macros in etex.src hard to extend to further register types as they assume specific 26x and 27x count range. For compatibility the existing register allocation is not changed.

```
45 \chardef\eQalloc@top=65535
46 \let\e@alloc@chardef\chardef
47 \def\e@alloc#1#2#3#4#5#6{%
48 \global\advance#3\@ne
49 \e@ch@ck{#3}{#4}{#5}#1%
50 \allocationnumber#3\relax
51 \global#2#6\allocationnumber
52 \wlog{\string#6=\string#1\the\allocationnumber}}%
```

```
53 \gdef\e@ch@ck#1#2#3#4{%
    \ifnum#1<#2\else
      56
        #1\@cclvi
        \ifx\count#4\advance#1 10 \fi
57
58
      \ifnum#1<#3\relax
59
60
      \else
         \errmessage{No room for a new \string#4}%
61
      \fi
62
    \fi}%
  Two simple LATEX macros used in ltlatex.sty.
64 \long\def\@gobble#1{}
65 \long\def\@firstofone#1{#1}
  Fix up allocations not to clash with etex.src.
66 \expandafter\csname newcount\endcsname\e@alloc@attribute@count
67 \expandafter\csname newcount\endcsname\e@alloc@ccodetable@count
68 \expandafter\csname newcount\endcsname\e@alloc@luafunction@count
69 \expandafter\csname newcount\endcsname\e@alloc@whatsit@count
70 \expandafter\csname newcount\endcsname\e@alloc@bytecode@count
71 \expandafter\csname newcount\endcsname\e@alloc@luachunk@count
  End of conditional setup for plain T<sub>E</sub>X / old L<sup>A</sup>T<sub>E</sub>X.
72 \fi
73 (/tex)
```

# 75.3 Attributes

\newattribute

As is generally the case for the LuaTeX registers we start here from 1. Notably, some code assumes that \attributeO is never used so this is important in this case.

```
74 \ifx\eQallocQattributeQcount\Qundefined
75 \countdef\eQallocQattributeQcount=258
76 \fi
77 \def\newattribute#1{%
78 \eQalloc\attribute\attributedef
79 \eQallocQattributeQcount\mQne\eQallocQtop#1%
80 }
81 \eQallocQattributeQcount=\zQ

\setattribute
Handy utilities.
\unsetattribute
82 \def\setattribute#1#2{#1=\numexpr#2\relax}
83 \def\unsetattribute#1{#1=-"7FFFFFF}\relax}
```

# 75.4 Category code tables

\newcatcodetable

Category code tables are allocated with a limit half of that used by LuaTeX for everything else. At the end of allocation there needs to be an initialisation step. Table 0 is already taken (it's the global one for current use) so the allocation starts at 1.

84 \ifx\e@alloc@ccodetable@count\@undefined

```
85 \countdef\e@alloc@ccodetable@count=259
86 \fi
87 \def\newcatcodetable#1{%
88 \e@alloc\catcodetable\chardef
89 \e@alloc@ccodetable@count\m@ne{"8000}#1%
90 \initcatcodetable\allocationnumber
91 }
92 \e@alloc@ccodetable@count=\z@
```

\catcodetable@initex \catcodetable@string \catcodetable@latex \catcodetable@atletter Save a small set of standard tables. The Unicode data is read here in using a parser simplified from that in load-unicode-data: only the nature of letters needs to be detected.

# 75.5 Named Lua functions

\newluafunction

Much the same story for allocating LuaTEX functions except here they are just numbers so they are allocated in the same way as boxes. Lua indexes from 1 so once again slot 0 is skipped.

```
173 \ifx\e@alloc@luafunction@count\@undefined
174 \countdef\e@alloc@luafunction@count=260
175 \fi
176 \def\newluafunction{%
177 \e@alloc\luafunction\e@alloc@chardef
178 \e@alloc@luafunction@count\m@ne\e@alloc@top
179 }
180 \e@alloc@luafunction@count=\z@
```

# 75.6 Custom whatsits

\newhatsit These are only settable from Lua but for consistency are definable here.

```
181 \ifx\e@alloc@whatsit@count\@undefined
182 \countdef\e@alloc@whatsit@count=261
183 \fi
184 \def\newwhatsit#1{%
185 \e@alloc\whatsit\e@alloc@chardef
186 \e@alloc@whatsit@count\m@ne\e@alloc@top#1%
187 }
188 \e@alloc@whatsit@count=\z@
```

# 75.7 Lua bytecode registers

\newluabytecode

These are only settable from Lua but for consistency are definable here.

```
189 \ifx\e@alloc@bytecode@count\@undefined
190 \countdef\e@alloc@bytecode@count=262
191 \fi
192 \def\newluabytecode#1{%

#### 75.10 Lua module preliminaries

```
274 (*lua)
```

Some set up for the Lua module which is needed for all of the Lua functionality

luatexbase

Set up the table for the returned functions. This is used to expose all of the public functions.

```
275 luatexbase
                    = luatexbase or { }
276 local luatexbase = luatexbase
```

Some Lua best practice: use local versions of functions where possible.

```
277 local string_gsub
                         = string.gsub
278 local tex_count
                         = tex.count
279 local tex_setattribute = tex.setattribute
280 local tex setcount = tex.setcount
281 local texio_write_nl = texio.write_nl
282 local luatexbase_warning
283 local luatexbase_error
```

#### 75.11 Lua module utilities

# 75.11.1 Module tracking

To allow tracking of module usage, a structure is provided to store information modules and to return it.

```
284 local modules = modules or { }
```

provides\_module Local function to write to the log.

```
285 local function luatexbase_log(text)
286 texio_write_nl("log", text)
287 end
```

Modelled on \ProvidesPackage, we store much the same information but with a little more structure.

```
288 local function provides_module(info)
289
    if not (info and info.name) then
       luatexbase_error("Missing module name for provides_module")
290
291
    local function spaced(text)
292
      return text and (" " .. text) or ""
293
294
    luatexbase_log(
295
```

304 local function msg\_format(mod, msg\_type, text)

# 75.11.2 Module messages

There are various warnings and errors that need to be given. For warnings we can get exactly the same formatting as from TeX. For errors we have to make some changes. Here we give the text of the error in the LaTeX format then force an error from Lua to halt the run. Splitting the message text is done using \n which takes the place of \MessageBreak.

First an auxiliary for the formatting: this measures up the message leader so we always get the correct indent.

```
305 local leader = ""
                    local cont
                306
                     local first_head
                307
                     if mod == "LaTeX" then
                308
                       cont = string_gsub(leader, ".", " ")
                309
                310
                       first_head = leader .. "LaTeX: "
                311
                     else
                       first_head = leader .. "Module " .. msg_type
                312
                       cont = "(" .. mod .. ")"
                313
                         .. string_gsub(first_head, ".", " ")
                314
                       first_head = leader .. "Module " .. mod .. " " .. msg_type .. ":"
                315
                316
                     if msg_type == "Error" then
                317
                       first_head = "\n" .. first_head
                318

# 75.12 Accessing register numbers from Lua

Collect up the data from the TEX level into a Lua table: from version 0.80, LuaTEX makes that easy.

```
349 local luaregisterbasetable = { }
350 local registermap = {
351 attributezero = "assign_attr"
                = "char_given"
352
    charzero
                 = "assign_int"
353 CountZero
                = assign_dimen"
354 dimenzero
355 mathcharzero = "math_given"
356 muskipzero
                  = "assign_mu_skip"
                  = "assign_skip"
    skipzero
357
                 = "assign_toks"
358 tokszero
359 }
360 local createtoken
361 if tex.luatexversion > 81 then
362 createtoken = token.create
363 elseif tex.luatexversion > 79 then
364 createtoken = newtoken.create
365 end
366 local hashtokens
                      = tex.hashtokens()
367 local luatexversion = tex.luatexversion
368 for i,j in pairs (registermap) do
    if luatexversion < 80 then
369
       luaregisterbasetable[hashtokens[i][1]] =
370
         hashtokens[i][2]
371
372
      luaregisterbasetable[j] = createtoken(i).mode
373
374
     end
375 end
```

registernumber

Working out the correct return value can be done in two ways. For older LuaTeX releases it has to be extracted from the hashtokens. On the other hand, newer LuaTeX's have newtoken, and whilst .mode isn't currently documented, Hans Hagen pointed to this approach so we should be OK.

```
376 local registernumber 377 if luatexversion < 80 then
```

```
function registernumber(name)
       local nt = hashtokens[name]
379
       if(nt and luaregisterbasetable[nt[1]]) then
380
         return nt[2] - luaregisterbasetable[nt[1]]
381
382
       else
383
         return false
       end
384
385
     end
386 else
     function registernumber(name)
387
       local nt = createtoken(name)
388
       if(luaregisterbasetable[nt.cmdname]) then
389
         return nt.mode - luaregisterbasetable[nt.cmdname]
390
391
       else
392
         return false
393
       end
     end
394
395 end
396 luatexbase.registernumber = registernumber
```

# 75.13 Attribute allocation

new\_attribute

As attributes are used for Lua manipulations its useful to be able to assign from this end.

```
397 local attributes=setmetatable(
398 {},
399 {
400 __index = function(t,key)
401 return registernumber(key) or nil
402 end}
403)

454
     luatexbase_log("Lua chunkname " .. (name or "") .. " = " ..
455
                    chunkname_count .. "\n")
456
     return chunkname_count
457
458 end
459 luatexbase.new_chunkname = new_chunkname
```

# 75.17 Lua callback management

The native mechanism for callbacks in LuaTeX allows only one per function. That is extremely restrictive and so a mechanism is needed to add and remove callbacks from the appropriate hooks.

# 75.17.1 Housekeeping

The main table: keys are callback names, and values are the associated lists of functions. More precisely, the entries in the list are tables holding the actual function as func and the identifying description as description. Only callbacks with a non-empty list of functions have an entry in this list.

```
460 local callbacklist = callbacklist or { }
```

Numerical codes for callback types, and name-to-value association (the table keys are strings, the values are numbers).

Now, list all predefined callbacks with their current type, based on the Lua $T_EX$  manual version 1.01. A full list of the currently-available callbacks can be obtained using

```
\directlua{
  for i,_ in pairs(callback.list()) do
    texio.write_nl("- " .. i)
  end
}
\bye
```

in plain LuaTEX. (Some undocumented callbacks are omitted as they are to be removed.)

```
468\; {\tt local}\; {\tt callbacktypes} \; {\tt =}\; {\tt callbacktypes} \; {\tt or} \; \{
```

Section 8.2: file discovery callbacks.

callback.register

Save the original function for registering callbacks and prevent the original being used. The original is saved in a place that remains available so other more sophisticated code can override the approach taken by the kernel if desired.

```
536 local callback_register = callback_register or callback.register
537 function callback.register()
538 luatexbase_error("Attempt to use callback.register() directly\n")
539 end
```

### **75.17.2** Handlers

The handler function is registered into the callback when the first function is added to this callback's list. Then, when the callback is called, the handler takes care of running all functions in the list. When the last function is removed from the callback's list, the handler is unregistered.

More precisely, the functions below are used to generate a specialized function (closure) for a given callback, which is the actual handler.

The way the functions are combined together depends on the type of the callback. There are currently 4 types of callback, depending on the calling convention of the functions the callback can hold:

**simple** is for functions that don't return anything: they are called in order, all with the same argument;

data is for functions receiving a piece of data of any type except node list head (and possibly other arguments) and returning it (possibly modified): the functions are called in order, and each is passed the return value of the previous (and the other arguments untouched, if any). The return value is that of the last function;

list is a specialized variant of data for functions filtering node lists. Such functions may return either the head of a modified node list, or the boolean values true or false. The functions are chained the same way as for data except that for the following. If one function returns false, then false is immediately returned and the following functions are not called. If one function returns true, then the same head is passed to the next function. If all functions return true, then true is returned, otherwise the return value of the last function not returning true is used.

**exclusive** is for functions with more complex signatures; functions in this type of callback are *not* combined: An error is raised if a second callback is registered..

Handler for data callbacks.

```
540 local function data_handler(name)
541 return function(data, ...)
542 for _,i in ipairs(callbacklist[name]) do
543 data = i.func(data,...)
```

```
544
       end
545
       return data
546
     end
547 \; {
m end}
Handler for exclusive callbacks. We can assume callbacklist[name] is not
empty: otherwise, the function wouldn't be registered in the callback any more.
548 local function exclusive_handler(name)
    return function(...)
       return callbacklist[name][1].func(...)
550
551
552 end
Handler for list callbacks.
553 local function list_handler(name)
    return function(head, ...)
       local ret
555
556
       local alltrue = true
557
       for _,i in ipairs(callbacklist[name]) do
558
         ret = i.func(head, ...)
559
         if ret == false then
560
            luatexbase_warning(
              "Function '" .. i.description .. "' returned false \n"
561
                .. "in callback '" .. name .."'
562
563
             )
564
            break
         end
565
566
         if ret ~= true then
567
           alltrue = false
568
           head = ret
569
          end
570
       end
571
       return alltrue and true or head
572
     end
573 end
Handler for simple callbacks.
574 local function simple_handler(name)

# 75.17.3 Public functions for callback management

Defining user callbacks perhaps should be in package code, but impacts on add\_to\_callback. If a default function is not required, it may be declared as false. First we need a list of user callbacks.

```
587 local user_callbacks_defaults = { }
create_callback The allocator itself.
                 588 local function create_callback(name, ctype, default)
                      if not name or name == ""
                      or not ctype or ctype == ""
                 591
                      then
                         luatexbase_error("Unable to create callback:\n" ..
                 592
                                          "valid callback name and type required")
                 593
                 594
                 595
                      if callbacktypes[name] then
                        luatexbase_error("Unable to create callback '" .. name ..
                 596
                                          "':\ncallback is already defined")
                 597
                 598
                       if default ~= false and type (default) ~= "function" then
                 599
                        luatexbase_error("Unable to create callback '" .. name ..
                 600
                                          ":\ndefault is not a function")
                 601
                 602

# 76.3 Lccodes for hyphenation

For 7- and 8-bit engines the assumption of T1 encodings is the basis for the hyphenation patterns. That's not the case for the Unicode engines, where the assumption is engine-native working. The common loader system provides access to data from the Unicode Consortium covering not only \lccode but also other related data. The \lccode part of that at least needs to be loaded before hyphenation is tackled: XeTeX follows the standard TeX route of building patterns into the format. LuaTeX doesn't require this data be loaded here but it does need to be loaded somewhere. Rather than test for the Unicode engines by name, the approach here is to look for the extended math mode handling both provide: any other engine developed in this area will presumably also provide \Umathcode.

There is one over-ride that makes sense here (see below for the same for 8-bit
engines): setting the lccode for - to itself.
     \lccode'\- ='\- % default hyphen char
The alternative is that a "traditional" engine is in use.
```

File O: ltfinal.dtx Date: 2017/03/09 Version v2.0t

158 **\else** 

We set things up so that hyphenation files can assume that the default (T1) lccodes are in use (at present this also sets up the uccodes). We temporarily define \reserved@a to apply \reserved@c to all the numbers in the range of its arguments.

```
159 \ensuremath{\mbox{\sc 159}} \ensuremath{\mbox{\sc 15
160
                                                            \@tempcnta#1\relax
161
                                                              \@tempcntb#2\relax
                                                              \reserved@b
162
163 }
164 \def\reserved@b{%
165
                                                              \ifnum\@tempcnta>\@tempcntb\else
166
                                                                                          \reserved@c\@tempcnta
                                                                                             \advance\@tempcnta\@ne
 168
                                                                                             \expandafter\reserved@b
 169
                                                              \fi
170 }
```

Depending on the T<sub>E</sub>X version, we might not be allowed to do this for non-ASCII characters.

The upper case characters need their \uccode and \lccode values set, and their \sfcode set to 999.

```
179 \def\reserved@c#1{%
180 \count@=#1\advance\count@ by "20
181 \uccode#1=#1
182 \lccode#1=\count@
183 \sfcode#1=999
184 }
185 \reserved@a{'\A}{'\Z}
186 \reserved@a{"80}{"9C}
187 \reserved@a{"CO}{"DF}
```

Well, it would be nice if that were correct, but unfortunately, the Cork encoding contains some odd slots whose uccode or lccode isn't quite what you'd expect.

Finally here is one that helps hyphenation in the OT1 encoding.

```
196 \lccode'\^^[='\^^[ % oe in OT1
```

And we also set the \lccode of \- and \textcompwordmark so that they do not prevent hyphenation in the remainder of the word (as suggested by Lars Helström).

# 76.4 Hyphenation

The following code will be compiled into the format file. It checks for the existence of hyphen.cfg in inputs that file if found. Otherwise it inputs hyphen.ltx. Note that these are loaded in *before* the \catcodes are set, so local hyphenation files can use 8-bit input.

We try to load the customized hyphenation description file.

\1@nohyphenation

```
214 \ifx\l@nohyphenation \@undefined
215 \newlanguage\l@nohyphenation
216 \fi
```

\document@default@language

Default document language. -1 acts as language 0, but used as a flag in \document to see if it has been set in the preamble.

217 \let\document@default@language\m@ne

# 76.5 Font loading

Fonts loaded during the formatting process might already have changed the \font@submax from Opt to something higher. If so, we put out a bold warning.

```
218 \ifdim \font@submax >\z@
219 \@font@warning{Size substitutions with differences\MessageBreak
220 up to \font@submax\space have occurred.\MessageBreak
221 \mathbb{MessageBreak}
222 Please check the transcript file
223 carefully\MessageBreak
224 and redo the format generation if necessary!
```

File O: ltfinal.dtx Date: 2017/03/09 Version v2.0t

```
225 \@gobbletwo}%
226 \errhelp{Only stopped, to give you time to
227 read the above message.}
228 \errmessage{}
We reset the macro. Otherwise every user will get a warning on every job.
229 \def\font@submax{Opt}
230 \fi
```

# 76.6 Input encoding

We temporarily define \reserved@a to apply \reserved@c to all the numbers in the range of its arguments.

```
231 \def\reserved@a#1#2{%
      \@tempcnta#1\relax
232
233
      \@tempcntb#2\relax
234
      \reserved@b
235 }
236 \def\reserved@b{%
      \ifnum\@tempcnta>\@tempcntb\else
237
          \reserved@c\@tempcnta
238
          \advance\@tempcnta\@ne
239
          \expandafter\reserved@b
240
241
      \fi
242 }
```

Set the special catcodes (although some of these are useless, since an error will have occurred if the catcodes have changed). Note that `¬J has catcode 'other' for use in warning messages.

```
243 \catcode' = 10
244 \catcode'\#=6
245 \catcode'\$=3
246 \catcode '\%=14
247 \catcode '\&=4
248 \catcode '\\=0
249 \catcode '\^=7
250 \catcode'\_=8
251 \code' = 1
252 \catcode'\}=2
253 \catcode '\~=13
254 \catcode \@=11
255 \catcode'\^^I=10
256 \catcode'\^^J=12
257 \catcode '\^^L=13
258 \catcode '\^^M=5
Set the 'other' catcodes.
259 \def\reserved@c#1{\catcode#1=12\relax}
260 \reserved@c{'\!}
261 \reserved@c{'\"}
262 \reserved@a{'\';}{'\?}
263 \reserved@c{'\[}
264 \reserved@c{'\]}
265 \reserved@c{'\'}
266 \reserved@c{'\|}
```

File O: ltfinal.dtx Date: 2017/03/09 Version v2.0t

```
Set the 'letter' catcodes.

267 \def\reserved@c#1{\catcode#1=11\relax}

268 \reserved@a{'\a}{'\z}

269 \reserved@a{'\a}{'\z}

All the characters in the range 0-31 and 127-255 are illegal, except tab (^^I), nl (^^J), ff (^^L) and cr (^^M).

Now allow 8-bit characters, although their use in this way is strongly discouraged. See inputenc.dtx for a supported mechanism for 8-bit input.

270 \def\reserved@c#1{\catcode#1=15\relax}

271 \reserved@a{0}{'\^*H}

272 \reserved@c{'\^*K}
```

# 76.7 Lccodes and uccodes

273 \reserved@a{'\^^N}{31}

We now again set up the default (T1) uc/lccodes. The lower case characters need their \uccode and \lccode values set. Some of this is a repeat of the set-up before loading hyphenation files. Depending on the TEX version, we might not be allowed to do this for non-ASCII characters. For the Unicode engines (XeTeX and LuaTeX) there is no need to do any of this: they use hyphenation data which does not alter any of the set up and so this entire block is skipped.

```
274 \ifnum 0%
     \ifx\Umathcode\@undefined\else 1\fi
     \ifx\XeTeXmathcode\@undefined\else 1\fi
276
277
    >\z@
278 \else
279 \def\reserved@c#1{%
      \count@=#1\advance\count@ by -"20
280
      \uccode#1=\count@
281
      \label{lccode}1=#1
282
283 }
284 \reserved@a{'\a}{'\z}
285 \reserved@a{"A0}{"BC}
286 \reserved@a{"E0}{"FF}
```

The upper case characters need their \uccode and \lccode values set, and their \sfcode set to 999.

```
287 \def\reserved@c#1{%
288 \count@=#1\advance\count@ by "20
289 \uccode#1=#1
290 \lccode#1=\count@
291 \sfcode#1=999
292 }
293 \reserved@a{'\A}{'\Z}
294 \reserved@a{"80}{"9C}
295 \reserved@a{"CO}{"DF}
```

Well, it would be nice if that were correct, but unfortunately, the Cork encoding contains some odd slots whose uccode or lccode isn't quite what you'd expect.

File O: ltfinal.dtx Date: 2017/03/09 Version v2.0t

```
300 \lccode'\^9d='\i % dotted I
301 \uccode'\^9d='\^9d % dotted I
302 \lccode'\^9e='\^9e % d-bar
303 \uccode'\^9e='\^1d0 % d-bar
Finally here is one that helps hyphenation in the OT1 encoding.
304 \lccode'\^1[='\^1[ % oe in OT1
305 \fi % End of reset block for 8-bit engines
```

\MakeUppercase \MakeUppercase \Quclclist And whilst we're doing things with uc/lc tables, here are two commands to upperand lower-case a string.

Note that this implementation is subject to change! At the moment we're not providing any way to extend the list of uc/lc commands, since finding a good interface is difficult. These commands have some nasty features, such as uppercasing mathematics, environment names, labels, etc. A much better long-term solution is to use all-caps fonts, but these aren't generally available.

```
306 \DeclareRobustCommand{\MakeUppercase}[1]{{%
307
        \def i{I}\def j{J}%
308
        309
        \expandafter\reserved@a\@uclclist\reserved@b\\reserved@b\@gobble}%
310
        \protected@edef\reserved@a{\uppercase{#1}}%
        \reserved@a
311
     }}
312
313 \DeclareRobustCommand{\MakeLowercase}[1]{{%
        \def\reserved@a##1##2{\let##2##1\reserved@a}%
314
        \expandafter\reserved@a\@uclclist\reserved@b\\reserved@b\@gobble}%
315
        \protected@edef\reserved@a{\lowercase{#1}}%
316
317
        \reserved@a
318
     }}
319 \def\Quclclist{\oo}\AE
```

The above code works, but has the nasty side-effect that if you say something like:

```
\markboth{\MakeUppercase\contentsname}
{\MakeUppercase\contentsname}
```

then the uppercasing is only done to the first letter of the contents name, since the mark expands out to:

```
\mark{\protect\MakeUppercase Table of Contents}
{\protect\MakeUppercase Table of Contents}
```

In order to get round this, we redefine \MakeUppercase and \MakeLowercase to grab their argument and brace it. This is a very low-level hack, and is *not* recommended practice! This is an instance of a general problem that makes it unsafe to grab arguments unbraced, and probably needs a more general solution. For the moment though, this hack will do:

```
321 \protected@edef\MakeUppercase#1{\MakeUppercase{#1}} 322 \protected@edef\MakeLowercase#1{\MakeLowercase{#1}}
```

# 76.8 Applying Patch files

Between major releases, small patches will be distributed in files ltpatch.ltx which must be added at this point.

Patch file code removed.

```
